PREFACE

The Canada Year Book, the official annual compendium of information on the economic and social development of the nation, presents extensive statistical material and analytical commentary designed to describe and co-ordinate essential elements in the progress of Canada.

The six-months postponement of the publication of the current edition, resulting in the issue of the Canada Year Book 1952-53 early in 1953, has occasioned considerable revision of the organization of the volume and of its chapter material and permitted the incorporation of certain basic statistics from the 1951 Census. The former chapter on "History and Chronology" has been deleted and the section on "Chronology" transposed to the concluding chapter, while the various subjects formerly dealt with under "Miscellaneous Administration" have been incorporated elsewhere in the volume. For example, "Public Lands" appears in Chapter I and "The Indians and Eskimos" in Chapter III on "Population", while "The Department of the Secretary of State" and "The Civil Service of Canada" are dealt with in Chapter II on "Constitution and Government". This latter chapter has also been augmented by a new feature providing a succinct analysis of the administrative functions of the various Departments of the Federal Government. The chapter, "National Accounts and Related Economic Statistics", has been transposed to the latter part of the volume to consolidate in summary fashion the economic developments depicted in the earlier portion; the "Survey of Production" remains well up in the volume as an introduction to the various chapters portraying Canada's primary and secondary industries. The survey of "Veterans Health and Welfare Services" appears as Part IV of Chapter VI, "Public Health, Welfare and Social Security". Special articles published in former editions of the Canada Year Book are listed in the concluding chapter along with "Sources of Official Information", a "Register of Official Appointments", classified "Federal Legislation, 1951-52" and "Canadian Chronology, 1867-1952".

Basic demographic statistics, compiled from the Ninth Census (1951)—Canada's comprehensive decennial stock-taking, appear in the chapter on "Population", while more detailed analyses of the Census, bearing on population, agriculture and industry, will be developed in the 1954 edition of the Year Book.

Other special features of the current edition include the following articles: "Game Fish in Canada's National Parks" (pp. 34-36); "Canada's External Relations" (pp. 101-124), surveying the nation's growth in international status and its international activities during the years 1950-52; "The Development of Public Health, Welfare and Social Security in Canada" (pp. 224-229); "Report of the Royal Commission on National Development in the Arts, Letters and Sciences" (pp. 342-345); "The National Research Council" (pp. 359-365); "The Pulp and Paper Industry in Canada" (pp. 467-475); "Post-War Expansion in Canada's Mineral Industry" (pp. 476-495); "Canadian Crude Petroleum Situation" (pp. 524-527); "The International Civil Aviation Organization and Canada's Participation Therein" (pp. 820-827); the "Grain Trade—Marketing Problems and Policies, 1949-1952" (pp. 865-869); and "Review of Foreign Trade" (pp. 922-929).

The regular chapter material has been revised considerably and brought up to date, and new statistical data covering two additional years have generally been included. In some cases, new features have been added as, for example, a list of

Canada's Foreign Trade Service representatives abroad (pp. 987-990), a discussion of the new measure of retail prices entitled "The Consumer Price Index" (pp. 1010-1014) and estimated book value of investments in all petroleum companies (pp. 1088-1089). The statistical detail of Federal Government expenditure, Mar. 31, 1949-1952 (pp. 1033-1034) has been recast; and summaries of current Federal legislation are complete to December 1952. The Appendices at the close of the volume recount legislation pertaining to the Redistribution of Federal Parliamentary Constituencies, 1952, and list the personnel of five Provincial Governments elected to power since mid-summer 1952. The Introduction to the volume serves to highlight the major economic developments of 1951 and 1952.

The co-operation of numerous officials of the various Departments of the Federal and Provincial Governments in the preparation of material for the Year Book is hereby gratefully acknowledged.

The present volume has been produced in the Information Services Division of the Bureau under the Editorship of C. C. Lingard, M.A., Ph.D., assisted by the Year Book Staff. Charts and graphs have been prepared under the direction of J. W. Delisle, Senior Draughtsman of the Bureau.

With a view to the improvement of future editions, the Editor welcomes information bearing on any errors or omissions that may have escaped notice and suggestions respecting methods of treatment.

HERBERT MARSHALL,
Dominion Statistician.

WEIGHTS AND MEASURES AND OTHER INTERPRETATIVE DATA

In Canada, as a rule, the imperial system of weights and measures is followed. An exception, however, is the ton where, unless otherwise stated, the short ton of 2,000 lb. is meant.

The following table shows the weights and measures used in Canada in connection with the principal field crops and for wheat flour and fruits:—

	<i>Pounds per Bushel</i>		<i>Pounds</i>
Grains—		Fruits (standard conversions)—	
Wheat.....	60	Apples, per barrel.....	135
Oats.....	34	Apples, per box.....	43
Barley.....	48	Pears, per bushel.....	50
Rye.....	56	Plums “ “.....	50
Buckwheat.....	48	Cherries “ “.....	50
Flaxseed.....	56	Peaches “ “.....	50
Corn.....	56	Grapes “ “.....	50
Mixed grains.....	50	Pears, per box.....	42
All others.....	60	Strawberries, per quart.....	1·25
		Raspberries “ “.....	1·25
		Loganberries “ “.....	1·25

Wheat Flour—

1 barrel equals 196 pounds and approximately 4·5 bushels of wheat are used in the production of a barrel of flour.

Relative Weights and Measures, Imperial and United States

The following tables of coefficients may be used to translate amounts expressed in one unit to the other.

1 Imperial pint=20 fluid ounces.	1 Imperial proof gallon=1·36 United States proof gallon.
1 United States pint=16 fluid ounces.	1 Short ton=2,000 pounds.
1 Imperial quart=40 fluid ounces.	1 Long ton=2,240 pounds.
1 United States quart=32 fluid ounces.	1 Barrel crude petroleum = 35 Imperial gallons.
1 Imperial gallon=160 fluid ounces.	
1 United States gallon=128 fluid ounces.	

FISCAL YEARS OF FEDERAL AND PROVINCIAL GOVERNMENTS

The fiscal year of the Federal Government and of each of the ten Provincial Governments ends on March 31.

Throughout the Year Book, fiscal-year figures are indicated in the text and headings of tables; in all other cases figures are for calendar years.

INTRODUCTION

Economic Developments in Canada during 1951 and 1952*

The post-war period up to 1950 was one of sustained activity and continuous growth in the Canadian economy, although toward the end of this period the over-all pressure on productive resources had slackened perceptibly as reflected in general price levels that remained fairly stable.

The even tempo of activity was abruptly interrupted by a chain of international events commencing with the invasion of South Korea in June 1950. The decision of the United Nations to resist this invasion and the policy of the NATO countries to improve their state of military preparedness led to large new demands being placed on the Canadian economy. Adjustment to this new stimulus was the principal influence underlying economic developments in the years 1951 and 1952.

The new demands which emerged were both extensive and varied. There was, first, the greatly expanded direct defence program which, at its height in the ensuing three year period, was expected to absorb close to 10 p.c. of the national product. Increased activity in other Western Nations brought substantially larger requirements for many of Canada's major exports. The changed situation gave new urgency to capital expansion and to the development of natural resources and gave rise, at least temporarily, to an upsurge of consumer purchasing and business inventory accumulation. In other words, the turn of international events had a pronounced stimulating effect throughout the Canadian economy and a major result was the acceleration in the rate of growth in the economy, reflected in the levels of capital investment and resource development, immigration and national output.

The sharpest up-turn in output occurred in the period immediately following the outbreak of hostilities in Korea. Within the 12 month period ending in the first quarter of 1951 industrial output increased by 14 p.c. This enhanced level of production was sustained in the ensuing two years. Total physical national output increased by about 5 p.c. in each successive year between 1949 and 1952, compared with an average annual increase of less than one-half this amount for the period 1946-49. It should be noted that in 1951 and again in 1952 the rise in output was, in part, the result of unusually good crops. In 1952, Canada's wheat crop reached 688,000,000 bushels or 121,000,000 bushels more than the previous record in 1928.

Increased availability of manpower helped to make possible the growth in national output in recent years. In the two years, 1951 and 1952, a total of 360,000 persons migrated to Canada. This was more than double the average annual rate of inflow from 1946 to 1950. Augmented by a higher net inflow of persons from abroad the Canadian civilian labour force increased by about 73,000 between 1950 and 1951 and by approximately the same number in 1952. Within the civilian sector of the labour force there has been a continuing transfer out of agriculture that accounts in part for the increase in the civilian non-agricultural labour force from 4,116,000 in 1950 to 4,257,000 in 1951, and to 4,403,000 in 1952. With unemployment remaining at low levels, numbers employed have roughly paralleled the changes in the labour force. Numbers on strength in the Armed Services have also been increasing.

* Prepared by the Director of the Economic Division, Department of Trade and Commerce, Ottawa.

Continuing expansion in capital facilities contributed to the growth in national output. In the last two years, outlays for capital goods accounted for about 22 p.c. of national expenditure. While part of this expenditure was needed to offset the depreciation in the existing stock of capital, a major portion represents a net expansion of productive facilities.

Further examination of the forces operating in the Canadian economy during the past two years is prefaced by a brief review of market trends during the period.

Market Trends in 1951-52.—The acute demand pressures which developed in the latter half of 1950 had reached a peak early in 1951 that can be attributed only to a very limited degree to rearmament and to directly related needs. At this time, programs for expanded defence establishments were still in the preparatory stage and therefore exerted little direct impact on western economies. The boom conditions which developed in this period appear to have reflected the public reactions to new fears of war and to projected rearmament. Consumers and businessmen alike, pre-occupied with sharply rising prices and anticipating shortages, stocked up goods well in excess of current needs. By the first quarter of 1951, retail sales in Canada had reached a level 20 p.c. in value and 10 p.c. in unit volume above the same period a year earlier. Moreover, from mid-1950 to mid-1951 the value of business inventories increased by about \$1,750,000,000 or close to 30 p.c. Part of this increase was simply a reflection of higher prices but there was also a substantial rise in the physical volume of goods held. For the year ended mid-1951, higher purchases by consumers and business stock-piling absorbed the major portion of the increase in the supply of goods and services available in the Canadian market, including that originating from higher domestic output and from a larger volume of imports.

During this period, speculative forces were sustained by a continuing deterioration in the international picture. A second wave of precautionary buying had developed late in 1950 following the setback suffered by United Nations Forces in Korea when China entered the conflict. Moreover, as the situation darkened rearmament goals kept rising. It was early in 1951 before the general magnitude of United States rearmament objectives for the next few years became known. In Canada, the defence program of \$1,000,000,000 annually, contemplated in the autumn of 1950 was raised to \$1,700,000,000 some months later.

A reaction to these inflated market demands commenced in the second quarter of 1951. While the change in the market atmosphere was international in character, anti-inflationary measures enacted by the Federal Government contributed to the easing of demand pressures. Some materials and goods remained in tight supply, particularly those needed directly in defence and supporting activity. Nevertheless, it was now becoming apparent that North American defence objectives could be attained without the degree of dislocation in the civilian economy at first envisaged. As a result, public concern over shortages began to disappear and precautionary buying quickly subsided. In so far as many persons had stocked up in anticipation of future needs, particularly in the case of durables and to some extent clothing, there followed a period of slack demand in various consumer-goods lines and in some industrial centres of Ontario and Quebec. By the last quarter of 1951, over-all retail sales in volume terms were running below those of the

previous year. In the case of business inventories, when shortages did not materialize, many firms were caught with excess stocks, a condition which was accentuated by the falling off in consumer demand and, in many lines, building up of stocks gave way quickly to liquidation.

There was, however, no general decline in activity. A growing volume of requirements for defence, for investment and for exports were important supporting factors in the economy. At the beginning of 1952, over-all production and employment levels were about the same as of the previous year. Nevertheless, the changing pattern of demand was bringing about a shift in emphasis away from the consumer and toward an improvement in Canada's industrial and defence potential.

The approximately even balance of market forces prevailing at this time continued well into 1952. However, by the middle of the year a considerable strengthening in consumer demand had taken place. The removal, early in 1952, of the special excise taxes on durables and the suspension of consumer credit regulations gave a spurt to hard goods purchasing. In addition, average personal income, in real terms, was rising significantly. Prices having roughly stabilized, consumers appeared to be showing less resistance to prevailing prices and many buyers, who in the post-Korean buying boom had bought ahead of their current needs, seemed to be returning gradually to the market for replacement needs. This pick-up in consumer demand continued throughout the second half of 1952 but was not such as to cause a resurgence of inflationary pressure. However, it did help to eliminate some of the soft spots that had previously existed and it also contributed toward some firming in over-all activity. Thus, in the second half of 1952, national production and employment levels experienced significant gains. Unemployment, throughout most of 1952 had run above the 1951 level.

Price trends throughout the two-year period reflected, in general, the changing pressures in the market but there were wide variations in the movements of prices of particular commodity groups. The inflationary influences of the post-Korean boom period had their greatest effect on internationally traded commodities. The most pronounced increases occurred in the non-dollar commodities such as rubber, tin, wool and various tropical foods, some of which more than doubled in price over the course of a six to 12 month period. The increases seemed attributable more to influences emanating from the acute international uncertainties of the time and the fear of all-out war than to the more modest needs likely to arise in a period of rearmament. Consequently, once the international situation began to stabilize and speculative forces began to subside, prices of these same commodities fell sharply. In some instances prices receded to, or below, levels prevailing in June 1950 and, subsequently, have fluctuated within a range well below the previous high points. On the other hand, prices of commodities important to Canada's export trade such as grain, wood-products, base metals and other minerals, while initially experiencing less spectacular though substantial gains, have subsequently shown less tendency to decline.

The divergence in price movements between prices of commodities important in foreign trade resulted in considerable fluctuation in Canada's terms of trade. For the year ended June 1951, import prices rose by 19 p.c. compared with a 13 p.c. rise for exports. For the subsequent 15 month period, the import index declined by 18 p.c., whereas export prices declined by only 4 p.c. Consequently, for the entire period from mid-1950 to the end of 1952 the change in the terms of trade has been significantly in Canada's favour.

General price levels in the domestic market during this period were strongly influenced by prices of international commodities but, in addition, have reflected influences originating internally. Wholesale prices showed particular sensitivity to the demand pressures of the early post-Korean period and, in the 9 months ending in March 1951, rose by 14 p.c. However, in the second quarter of 1951 the wholesale index levelled off and, after mid-1951, maintained a fairly continuous decline from a peak of 244 in July of 1951 to 221 in October 1952. On the other hand, the cost-of-living index continued upward until near the end of 1951 when it reached a position 14 p.c. above July 1950. During 1952, the consumer price level declined slightly, the index showing a 2 p.c. reduction between the beginning and end of that year.

As previously indicated, market conditions were fairly firm during 1952 and many industrial sectors experienced firm to rising price trends. Influences largely responsible for the declining trend in over-all prices included the pronounced reduction in import prices, the softening in markets for a number of Canada's agricultural products and the appreciation in the foreign-exchange value of the Canadian dollar.

Government Measures in the Defence Economy.—The demand upsurge which followed the War in Korea gave rise to two major problems on the economic front. The first was the necessary assurance of sufficient resources to carry out Canada's new defence objectives. The second was the containing of inflationary pressures and the maintenance of the maximum degree of stability consistent with the achievement of these objectives.

Measures to Assist Directly the Defence Program.—Even as Canada's rearmament objectives were taking shape it became apparent that, at least temporarily, strong competing demands would exist for many of the materials and resources needed for defence production. Thus, for the defence program to proceed without hindrance some form of prior claim on scarce resources became necessary. Legislation was enacted under which it was possible to ensure that the essential requirements of defence and defence-supporting activities would be met.

Direct controls brought into effect measures regulating the distribution of materials essential for defence. They were few in number and were applied mainly at the primary level. In only a few instances were restrictions placed on the final use of materials, the one notable case being the use of steel for less essential forms of construction (places of amusement, stores, hotels, banks, restaurants, etc.) which were subject to regulation from the autumn of 1950 to the end of 1952.

Materials designated as 'essential' and thereby subject to specific control included certain forms of iron and steel, certain forms of non-ferrous metals and non-metallic minerals, wood-pulp and newsprint, and certain chemicals and chemical compounds. With the easing of supply positions, a number of these materials were removed from the 'designated' list during 1952.

In the case of steel supplies the policy has been to effect the diversion of necessary supplies to defence purposes at the mill, warehousing or fabricating levels. Wood-pulp and newsprint were, for a time, subject to control primarily to facilitate the diversion of relatively small quantities to fill urgent European needs. In the case of all other 'essential' materials, control has been exercised through an "order approval system" involving the screening of orders placed by manufacturers with the primary processor.

In addition to procedures affecting the foregoing designated materials, provision was also made for the exercise of control as necessary over all items required in the defence effort. However, to a very large extent the desired objectives have been achieved through informal arrangement with a minimum resort to formal control orders.

Measures designed to facilitate the placement of necessary plants and other defence facilities included provision for capital assistance, special capital cost allowances or accelerated depreciation.

With respect to commodities imported from the United States, in accordance with the "Statement of Economic Principles", Canada has participated fully in both the United States Controlled Materials Plan and the United States priority regulations. Similarly, United States defence requirements in Canada have been dealt with in the same manner as Canada's own defence requirements.

In addition to regulations affecting the internal distribution of specific commodities it was found necessary to apply certain controls in the foreign trade field. Export controls were used in the case of a few commodities to protect essential domestic supplies and also as a means of controlling the destination of strategically important materials. In the case of imports, certain iron and steel items were placed under control to assist in their allocation under the priorities system and sulphur was placed under regulation to facilitate conformity with the International Materials Conference Allocation Scheme.

Measures to Restrain Inflationary Forces.—In the earlier boom phase following the outbreak of the Korean War, one objective of Government policy was the scaling down of excessive demands to a level commensurate with the productive resources available in the country.

The core of this anti-inflationary approach was the Federal Government's strict pay-as-you-go policy for the financing of the defence program. The aim was to insure that each dollar expended on defence would be counter-balanced by the withdrawal of a corresponding amount of purchasing power from private funds that would otherwise have been available for other forms of spending. In this way civilian demand was replaced by defence demand and production for civilian use by production for defence. The Federal Budgets of September 1950 and April 1951 made provision for additional revenue principally through increases in individual and corporation income-tax rates and also through the levy of special commodity taxes on cars, various household durable goods, soft drinks and tobacco products. These special levies were removed subsequently in the Budget of April 1952. In the circumstances of excessive demand which prevailed at the height of the post-Korean boom, further supplementary measures were adopted to help bring about a more even balance between demand and supply.

To assist the necessary transfer of resources to defence and to curb consumer demands, regulation of instalment buying and consumer credit was introduced in October 1950 and these regulations were tightened on subsequent occasions. To ease the pressure of demand for investment goods, a new fiscal measure was introduced in the Budget of April 1951. This measure provided that no depreciation could be charged for a period of four years on capital assets acquired after Apr. 10, 1951, excepting projects considered by the Government as essential to present national needs. Also, as a means to discourage demands for new construction, credit provisions under the National Housing Act were tightened in February

1951, one of the principal changes being to increase the size of down payments required on loans financed under the Act. In January 1951, reduction was made in the period of credit allowed on loans under the Farm Improvements Loans Act. Of more general application as an anti-inflationary measure was the undertaking by the Chartered Banks, in February 1951, to implement proposals of the Bank of Canada designed to prevent further increase in the over-all volume of bank credit. This served to counteract demand pressures at what was probably their focal point by curtailing credit for non-essential purposes and by restricting the volume of funds available for capital expansion and for the building of inventories.

The implementation of anti-inflationary measures in Canada, and like-intended programs in other countries, appeared roughly to coincide with the underlying change in the market atmosphere. Both these sets of influences contributed to the subsequent easing of demand pressures which, as previously indicated, were absent from the economy since the latter part of 1951.

With the achievement of more stable conditions in the economy these supplementary anti-inflationary measures were gradually rescinded. Following the softening in the consumer market and the sharp decline in durable goods' sales in the latter part of 1951, consumer credit regulations were relaxed in January 1952 and were suspended in their entirety in the April Budget. In May 1952, the special policies of bank credit restraint, which had been in effect since February 1951, were suspended except for the requirement of a margin of at least 50 p.c. for bank loans to carry corporate stock. In October 1951, a measure of liberalization in credit provision under the Housing Act was implemented and further measures were made effective in December 1951 and in October 1952. The deferred depreciation measure ceased to be applicable on capital goods acquired after Dec. 31, 1952.

Industry Conditions.—During 1951 and 1952, conditions in Canadian industries reflected the changing pattern of demands which has been described. The general upswing in demand commencing in the last half of 1950 and extending into 1951 was felt in virtually all segments of Canadian industry. During this period production levels in all major industry groups increased.

In the ensuing two year period, requirements for defence, for export and for capital investment kept rising and output in industries primarily dependent on these markets continued to increase. Generally speaking, this included defence industries such as aircraft and shipbuilding, metal mining and processing, wood products, other raw material industries, construction, heavy manufacturing industries and dependent service industries, although even in these groups, periods of softness were experienced in certain segments, as for example, in wood-pulp plants during 1952.

On the other hand, the falling off in the demand for various types of consumer goods commenced in the second quarter of 1951 and brought a pronounced decline in activity in related industries. This decline was accentuated as a result of the extensive accumulation of inventories which had previously taken place in anticipation of future shortages. Thus, by the third and fourth quarters of 1951, output of a number of the major consumer durable items had fallen to less than one-half their early year levels. The clothing and textile industries also underwent a sharp decline in activity. In the case of this industry group, the market recession was world-wide in character. Thus, in addition to a falling off in market demand, Canadian producers were also faced with increased competition from abroad. By

the first quarter of 1952, production of clothing was 15 p.c. below the level of the same period in 1951. In other textiles a year-to-year comparison in the second quarter showed a 30 p.c. drop.

Throughout 1952, influences contributing to a strengthening of demand for consumer goods included the continuing increase in money incomes, a moderate decline in the consumer price level, the suspension of consumer credit regulations and the removal of the special commodity taxes in the April Budget. As consumer purchasing increased, excessive inventories were gradually adjusted and by the latter part of 1952 production in consumer goods industries had increased substantially above the depressed levels of the previous period. By the last quarter of 1952, activity appeared to be at a generally high level throughout all segments of Canadian industry except perhaps in logging where the current season's cut was expected to be considerably below that of 1951.

During the 1951-52 period, Canadian agriculture was subject to unusually divergent influences. In 1951, western grain producers obtained much better than average yields but owing to unusually bad weather conditions much of the grain was of low grade and a large portion of the crop was not harvested until the next spring. This was followed by the new record crop of 1952. Throughout these two years overseas demand for Canadian wheat and other grain remained strong owing, in part, to poor crops in other important export countries. In addition, large amounts of feed grain were marketed in the United States. Transportation and handling facilities were not adequate to move the huge export surpluses on hand and this constituted the principal limiting factor to the volume of export sales. As a result there was a substantial increase in grain stocks in Canada.

Meanwhile, Canada's live-stock industry suffered a major setback with the outbreak of foot-and-mouth disease, in Saskatchewan, in February 1952. This brought an automatic closing of the United States border to all Canadian live stock and related products, involving the loss of a market which, in recent years, had absorbed up to 20 p.c. of Canada's cattle and beef production. At the same time, hog marketings increased greatly, resulting in a substantial surplus of meat in Canada during 1952. The beef surplus was, to some extent, alleviated by an arrangement whereby the United Kingdom bought Canadian beef in place of the New Zealand product which, in turn, was sold in the United States market. By the end of 1952, about 65,000,000 lb. of beef had been shipped to the United Kingdom under this arrangement. To assist the Canadian industry over this difficult period, the Agricultural Prices Support Board provided support to both pork and beef by purchasing surplus supplies at designated prices and it was announced that support for beef prices would continue until the United States embargo against Canadian live stock was lifted.

Mainly as a result of the good crops in 1951, Canadian farm income rose by 32 p.c. over that of the previous year. In 1952, the rise in crop production was more than offset by lower prices for agricultural products and increased operating costs and it was estimated that farm income in 1952, though remaining well above the 1950 level, would be a little below that realized in 1951.

The Defence Program.—The building up and equipping of Canada's Armed Services, together with the provision of a considerable volume of equipment for other NATO countries, were among the principal new demands on the country's resources during 1951 and 1952. Actual outlays for direct defence purposes increased from \$493,000,000 in 1950 to three to four times this amount in 1952. Such outlays

comprised about 2.75 p.c. of the gross national product in 1950 and about 8 p.c. in 1952. Of the total expenditure for the period roughly 33 p.c. was required for military pay and allowances and for administrative and service expenses, the remainder going for procurement of equipment and supplies and for construction.

The build-up of the program, of necessity, took time, for many types of equipment deliveries had to await the perfecting of new designs, tooling up and, in some cases, the erection of new plants. Thus, the year 1951 was primarily one of preparation, of designing and constructing plant and equipment, of determining types of military goods to be produced, of undertaking development work and of placing some of the more important contracts. Government measures enacted to facilitate the creation of the necessary capacity and to ensure availability of required materials have been referred to at pp. xiv-xvi. Meanwhile, the purchasing of various items requiring no special facilities proceeded.

During 1952, many specialized facilities were completed and the production commenced of various more complicated items. An outstanding example is the plant making Orenda jet engines, which was opened in September 1952. Rapid progress is being made in setting up capacity for producing such Orenda components as fuel systems, combustion chambers, light metal castings, and turbine blading. In shipbuilding, Canada is able to produce the propulsion machinery for its own escort vessels. Under the weapons program, new facilities were created for the manufacture of various U.S.-type equipments. In the electronics field also, Canada is keeping abreast of the rapidly changing situation, and now possesses capacity to turn out such items as walkie-talkies, gunfire control equipment, and subminiature tubes.

The major impact of defence purchasing has been concentrated in but few industries. Of total procurement outlays for 1952, aircraft accounted for 27 p.c., construction 22 p.c., shipbuilding 8 p.c., clothing and other textiles 10 p.c. and electronics, weapons, automotive equipment, ammunition and explosives taken together totalled 22 p.c. As the program progresses, major equipment items such as aircraft, ships, guns, ammunition and electronics will comprise an increasing proportion of total procurement.

The influence exerted by defence purchasing on Canada's balance of payments position altered significantly during the years 1951 and 1952. This, of course, excludes the United States content of orders filled by private contractors. The value of Canadian Government defence orders placed in the United States in 1951 was nearly two and a half times as large as United States orders placed in this country. The position was, however, greatly altered in 1952 and the totals for the two years were not far from being equal. This development took place for several reasons: the United States was becoming increasingly aware of Canadian facilities, while Canada was able to depend more fully upon its own sources of supply and, in some cases, to reduce or cancel orders already placed in the United States. During 1951, in particular, the United States was the only available source for U.S.-type equipment but with Canada's increasing capacity to supply its own needs the decision was made to use the Orenda engine produced by A. V. Roe (Canada) Limited to replace the U.S.-J 47 in the F-86E fighters.

Considering the impact of the defence program on the economy as a whole, it is apparent that expanding defence requirements absorbed a major portion of the increase in national output in the two years under review. Nevertheless,

it is of significance that in 1952 there was an increase in the volume of exports and in capital investment and a slight improvement in per capita consumption. The outstanding feature of the defence program is in its specialized technical aspects rather than in its requirements of manpower, materials and productive capacity in the more general sense.

Foreign Trade.—Events which followed the outbreak of the conflict in Korea had a pronounced stimulating effect on Canada's trade with other countries. A major portion of the new stimulus to activity in the Canadian economy had its origin in the foreign market. Rising production levels in other countries meant larger requirements of many raw and processed materials for which Canada is an important and economic source of supply. The accompanying rise in activity and in the demand for goods in Canada resulted, in turn, in a heavier flow of imports. Nevertheless, the respective trends of exports and imports followed a somewhat different course in the period since 1950.

In response to urgent demands from abroad, Canadian exports rose steadily during 1951 with availability of supply being the main limiting factor to the volume shipped. The value of merchandise exports in 1951 reached \$3,963,000,000, 26 p.c. above the 1950 figure. Higher prices and more unit volume contributed about equally to this rise. In 1952 the general pressure of demand for raw materials slackened somewhat as evidenced by the levelling and, in some instances, decline in prices but the foreign market continued to absorb virtually all the available supply of important export items. Thus, sales abroad continued to mount and for the full year the value of exports showed an increase of 10 p.c. over the same period in 1951. With average prices being unchanged, the physical volume of shipments also rose by 11 p.c. or approximately at the same rate of increase realized in the preceding year.

Throughout the two-year period under review larger shipments of grain, metals and wood products made up nearly all the increase in the total value of exports. Commencing in the latter months of 1951 and continuing through 1952, exports of automotive products increased sharply, particularly to Latin-American countries, and by the end of 1952, shipments of defence equipment to the United States were of increased importance.

The 1950-51 boom brought a much quicker expansion in imports than in exports. For one thing supply limitations did not exert the same restrictive effects. In the United States, by far the largest source of supply, soaring production levels had in many fields kept pace with market demands. Even in instances where supplies remained tight, as in the case of steel, Canadian purchases increased markedly. The removal of all the remaining emergency exchange import controls on Jan. 1, 1951, also contributed to the overflow of Canadian demand into the United States market. Thus, in the first six months of 1951, Canadian purchases abroad were 45 p.c. above the corresponding period of 1950. However, in the third quarter of the year the scramble after goods in the foreign market began to subside. For the year 1951 the value of merchandise imports stood at \$4,085,000,000, 29 p.c. above the 1950 level (13 p.c. higher in terms of unit volume).

The easing in purchasing from abroad, which commenced in the latter half of 1951, continued well into 1952 and reflected the over-building of inventories during the earlier buying splurge and also the decline in demand pressures in Canada. However, following the firming in the domestic market, import levels again started

to move upward in the latter months of the year. For 1952, the value of imports was 1 p.c. below that of 1951. However, for the same period, average prices of imported goods were 12 p.c. lower so that, in unit volume terms, foreign buying was again significantly higher.

Because of the sharper rise in imports than in exports during the 1950-51 boom period, in the calendar year 1951 a deficit on Canada's merchandise trade account was encountered for the first time in many years. Adding an increased deficit on non-merchandise items there was an over-all deficit on current international account of \$524,000,000. However, in 1952, the continued increase in the value of exports and the decline in imports realized a sizable balance on merchandise account sufficient to offset, approximately, the continuing deficit on invisible items. As a result of the rising trend of imports late in 1952 this favourable trend in the current account position appeared to have been reversed at least temporarily.

Meanwhile, the international capital position was also changing. The net inflow of capital into Canada which had reached the record amount of more than \$1,000,000,000 in 1950 declined to little more than 50 p.c. of this figure in 1951 which was, nevertheless, roughly sufficient to offset the deficit on current account. However, for 1952, the considerable volume of investment funds still moving into Canada were more than counter-balanced by funds moving out.

The foregoing changes in current and capital account were accompanied during most of the period by an appreciation in the foreign exchange value of the Canadian dollar, which rose from a discount of more than 6 p.c. on the American dollar in June 1951 to a premium of more than 4 p.c. in September 1952.

During the two year period under review, Canada's pattern of trade, area-wise, gradually moved away from the more evenly balanced position with major trading areas which had existed in 1950. The decline in the over-all merchandise balance in 1951 was associated with an even larger increase in the deficit with the United States (a \$479,000,000 deficit in 1951 compared with \$80,000,000 in 1950). On the other hand, the surplus with the Sterling Area rose. British purchases from Canada were considerably higher (particularly lumber and metals), whereas strong competing demands for United Kingdom products, coupled with a softening in the Canadian market for various consumer goods, particularly automobiles, tended to limit British sales to this country. In 1952, Canada's merchandise position with the United States remained about the same as in 1951; however, the surplus in trade continued to grow with the Sterling Area and with other non-dollar countries. In 1952 exports to countries, other than to the United States and the Sterling Area, increased by 33 p.c. over 1951, whereas in the same period imports from these countries decreased by 7 p.c.

The rise in exports to sterling countries in 1951-52 was realized notwithstanding a new exchange crisis encountered by the Sterling Area. The closing months of 1952 saw a major improvement in the foreign balance position of the Sterling Area and the measures taken further to restrict purchasing from dollar areas were beginning to reflect themselves in Canadian export figures. Throughout the period a collective approach to mutual problems of Commonwealth trade was taken by such means as the semi-annual meetings of the United Kingdom-Canada Continuing Committee on Trade and Economic Affairs, the meetings of the Commonwealth Finance Ministers, in January 1952, and the Commonwealth Economic Conference in November of the same year.

Canada took part in the large scale tariff negotiations under the General Agreement on Tariffs and Trade held at Torquay, England from September 1950 to April 1951 and also in the meetings held at Geneva in the autumn of 1951 and again in October 1952. Through its role in this and other international organizations and also in its relations with other countries, Canada's efforts were directed toward the removal of barriers to the free movement of goods and toward the achievement of a sound and dynamic pattern of world trade.

Capital Expenditure and Resources Development.—A notable feature of the post-war Canadian economy has been the large volume of capital expenditure on durable physical assets, such as manufacturing establishments and office buildings, machinery and equipment, schools and roads and residential housing. Private and public investment amounted to \$4,581,000,000 in 1951 and was estimated at \$5,181,000,000 for 1952. Of these totals, capital expenditure by federal, provincial and municipal governments amounted to \$774,000,000 in 1951 and to \$957,000,000 in 1952. In physical terms investment rose 9 p.c. in 1951 and 10 p.c. in 1952. Over the two year period, new construction accounted for 58 p.c. of total investment and machinery and equipment accounted for the remainder.

This represented about as large a volume of investment as the economy was capable of supporting under the conditions existing in 1951 and 1952. In physical size it was the largest on record. In terms of percentage of the gross national product which it represented, the investment program of 1929 was larger but the wave of investment which reached its peak in 1929 occurred at a time when there was no large rearmament program in progress and when general demand for goods and services was exerting less strain upon the economy than in recent years.

Investment in capital goods plays a vital role in maintaining and increasing the productive efficiency and capacity of the nation. In recent years about 50 p.c. of all capital expenditure has been required to offset depreciation and obsolescence. Large capital expenditure has been required to maintain employment and efficiency in the face of constantly changing patterns of domestic and international trade. With population rising, heavy capital expenditure has been required to utilize new manpower becoming available and to provide for the growing need for public works, services and housing. An indication of the rate at which Canada's productive potential has been increasing is provided by statistics on the rise in the nation's output of goods and services over a period of years. From 1947 through 1952, Canada's capital expenditure was high, its productive capacity was almost fully employed, and the gross national product, in real terms, rose by an average of about 5 p.c. per annum.

Composition of the Investment Program.—The investment programs of 1951 and 1952 were marked by the very large shifts which took place in their composition. This can be seen by recalling the conditions of 1950. In that year, while the volume of investment was very high, it was only slightly above the previous year; most of the post-war shortages of labour and materials had been relieved; resources development, as reflected by the rapidly rising capital expenditure on utilities and mining, was assuming greater importance. On the other hand, the post-war wave of expansion in light and in heavy manufacturing was subsiding and investment in these sectors declined for the second successive year. Expansion in housing, trade, finance and commercial services, retarded by the War and by post-war shortages, was proceeding rapidly. Government capital expenditure was rising only moderately and was marked by emphasis upon non-defence projects, such as roads.

This situation was changed radically over the two years following, mainly as a result of the outbreak of hostilities in Korea. Western rearmament created heavy additional demands for many of the raw and processed materials produced in Canada and placed new urgency on the development of resources and expansion of processing facilities. Moreover, Canada's own rearmament program, besides involving the construction of military installations, called for the production of a wide variety of military supplies on a scale which, in some cases, exceeded existing plant capacity, thereby calling for large capital expenditure.

Under these additional stimuli, capital expenditure on resources development continued to rise in 1951 and 1952, while that on light manufacturing continued to fall. The rate of government investment was accelerated and the declining trend of investment in heavy manufacturing was sharply reversed. Investment declined in housing and services not immediately essential for defence. The magnitude of these changes from 1950 to 1952 are reflected in the following figures, all reduced to constant 1950 dollars.

Capital expenditure by the Federal Government departments increased from \$127,000,000 in 1950 to \$320,000,000 in 1952, a rise of 152 p.c.; that by heavy manufacturing industries rose 145 p.c. from \$262,000,000 to \$642,000,000; that for mining, quarrying and oil wells rose 47 p.c. from \$119,000,000 to \$175,000,000; and that by utilities rose 42 p.c. from \$720,000,000 to \$1,025,000,000. On the other hand, capital expenditure for trade, finance, commercial services and institutional services fell 16 p.c. from \$605,000,000 in 1950 to \$505,000,000 in 1952; that of light manufacturing fell 12 p.c. from \$179,000,000 to \$159,000,000; and that for housing fell 15 p.c. from \$845,000,000 to \$710,000,000.

These shifts in the pattern of investment were facilitated by various measures (referred to at pp.xiv-xvi), designed to discourage less essential work and to ensure the availability of resources for projects of importance in Canada's preparedness program.

Housing.—As indicated before, the volume of residential construction declined considerably during the period under review but was again increasing by the latter half of 1952. Completions dropped from 92,000 dwellings and conversions in 1950 to 85,000 in 1951 and to an estimated 70,000 in 1952. The decline in house building activity first became evident in June 1951, when the rate of housing starts fell below that of the same month of the previous year. The rate of starts remained relatively low until a year later when, in June 1952, it rose to a point only slightly below that of June 1950. While starts in the last half of 1952 were well above the last half of 1951, this increase came too late to be fully reflected in the number of completions in 1952.

Various factors contributed to these changes in the volume of house building including the changing circumstances with respect to the supply of mortgage funds, availability of serviced land, building costs and public attitude concerning the future availability of materials. About two out of every five houses started in recent years have been constructed with financial assistance of some kind from the Federal Government, mainly under the National Housing Act, so that changes in governmental policy had a bearing on the level of house building activity. As a part of the Government's policy to preserve national and manpower resources for essential defence purposes, regulations were introduced early in 1951 which had the effect of increasing down payments on homes financed under the National Housing Act. Beginning in June 1951, it became apparent that the economy could support

a higher level of house building activity and the Government adopted a series of measures to encourage residential construction. The statutory interest rate on mortgages coming under the National Housing Act was raised, additional credit arrangements for the construction of rental projects were provided for, and the maximum size of mortgage permitted on homes for home ownership was increased.

Review of Current Expansion.—The significance of the investment programs of 1951 and 1952 can be further illustrated by a review of how some of the more important projects under way contributed to Canada's productive capacity and to the opening up of hitherto undeveloped areas.

The development of Canada's mineral resources proceeded on a broad front. The petroleum industry continued its rapid development originating in the discovery of new oil fields in Alberta in 1947 and 1948. Daily output of crude petroleum rose from 23,000 bbl. in 1945 to 80,000 bbl. in 1950 and to 160,000 bbl. in 1952. Rapid strides were made in the creation of facilities required to bring Ontario, British Columbia and parts of the United States within marketing range. In December 1950, the first crude oil reached the head of the Great Lakes via the new Inter-provincial pipeline and, subsequently, a new fleet of tankers was built to forward the oil to Sarnia, Ont. In 1952, construction was begun on the Transmountain pipeline which will carry Alberta oil to the West Coast. As a result of these and other developments in the marketing and refining of petroleum, about 33 p.c. of Canada's requirements were being met from domestic sources at the end of 1952 compared with 20 p.c. in 1950.

Output of iron ore rose from 3,400,000 tons in 1950 to 5,500,000 tons in 1952 owing mainly to expansion projects in Ontario and Newfoundland. Of even greater potential importance are deposits being opened up on the Labrador-Quebec border. This latter project, involving construction of a 360-mile railroad south to the Gulf of St. Lawrence, is expected to yield 10,000,000 tons or more of high grade ore a year and to raise Canada to the rank of a major net exporter.

Numerous discoveries of ore bodies and strong markets combined to make 1951 and 1952 years of significant expansion in a wide range of other minerals. The deposit of titanium bearing ilmenite at Allard Lake in the Province of Quebec was opened up and a refinery was erected at Sorel, Que.; this is probably the largest known deposit of ilmenite and its development has made Canada a major producer. Zinc mining and refining projects under way or recently completed in British Columbia, Manitoba, Quebec and Nova Scotia will increase potential output by about 85,000 tons over 1950. A large new nickel-copper-cobalt mine was being opened up at Lynn Lake, Man.; this project involves construction of a 155-mile railway and erection of a refinery at Fort Saskatchewan, Alta. In addition, a large number of important developments took place which added to productive capacity in asbestos, uranium, tungsten, cobalt and other minerals.

The expansion of the nation's production potential hinges, to some extent, on the availability of large supplies of low cost hydro-electric power. In 1951, installed capacity of electric generating stations was increased by 881,000 h.p. to a total of 13,343,000 h.p. New plants and extensions to existing stations under construction in 1952 were expected to bring total installed capacity to over 15,000,000 h.p. by the end of 1953.

Part of the new power capacity being installed was in direct conjunction with expansion in the refining of aluminum and other base metals. Two major aluminum refining projects were under way. The largest of these is located at Kitimat, a hitherto undeveloped area of British Columbia, and will be capable of an output of 90,000 tons of aluminum when the first stage of the project is completed. This, together with a project under way in the Province of Quebec will add 35 p.c. to Canada's aluminum refining capacity.

One of the most important developments in heavy manufacturing was the major expansion program undertaken by the primary iron and steel making industry which was scheduled for completion by the end of 1953. Pig iron capacity was being raised by 35 p.c. and steel making capacity by 25 p.c. In conjunction with this program, commensurate additions were being made to Canada's steel rolling mill capacity.

A number of other important developments in heavy manufacturing involved the processing of Canada's forest and mineral resources and the production of goods required for defence. Large plants were under construction in Alberta and Ontario to produce a wide variety of chemicals and synthetic fibres from products of petroleum and wood. Plants were being erected to recover sulphur from natural gas, smelter fumes and iron pyrites. A large new pulp and paper mill was completed in British Columbia during 1952, and a number of existing ones were expanded.

Of the developments in manufacturing directly related to defence, the most notable was the expansion of Canada's aircraft industry to produce jet fighter aircraft and jet engines. This involved not only capital expenditure on aircraft and engine plants but also the construction or adaptation of facilities by numerous concerns to produce a wide range of complex component parts, the manufacture of which called for a high degree of precision. Electronic equipment for the defence program necessitated significant expansion in the heavy electrical industry. Ship-yards, gun and explosive plants were also expanded.

The foregoing description gives a broad indication of the new productive capacity being created in the Canadian economy. It depicts forcibly that 1951 and 1952 have been years of exceptional activity and basic industrial growth. International events of this period have placed new emphasis on Canada's importance as a source of supply in the Western world. The growth thus stimulated has been concentrated in the building up of new capacity for the production of raw and processed materials. In addition, however, the production of highly complicated products has been embarked upon. This expansion has contributed to the greater diversification of Canadian industry and will undoubtedly provide renewed impetus to development in secondary and service industries in the years ahead.

STATISTICAL SUMMARY OF THE PROGRESS OF CANADA, 1871-1951

NOTE.—In the following summary, the statistics of fisheries (1871-1911), trade, shipping, the Post Office, the public debt, revenue and expenditure, and the Post Office and Government savings banks relate to the fiscal years ended June 30 up to 1906; subsequently to years ended Mar. 31, except in the case of trade, where, as indicated by footnotes, calendar-year figures are given for certain later years. Agriculture, dairying, fisheries (from 1931), mineral, manufacturing, banking, insurance, loan and trust companies, construction, road-transportation, vital, hospital, and immigration statistics relate to the calendar years, and railway statistics to the years ended June 30, 1871-1911, and to the calendar years 1921-51. Canal statistics are those of the navigation seasons. Telegraph statistics relate to the fiscal years for Government lines and to the calendar years for other lines.

STATISTICAL SUMMARY OF THE PROGRESS OF CANADA

NOTE.—The interpretation of the symbols used in the tables will be found facing p. 1 of this volume.

881-1921 are for the next preceding years. In the Censuses of 1881 and 1891 values only were given of factory butter and cheese; quantities have been calculated by reckoning cheese at 10 cents per lb. and butter at 25 cents per lb.

¹ Data shown for 1949-51 represent cheddar and other cheese made from whole milk; prior to 1942 the figures included other cheese for Quebec only.

² Prior to 1921 this item does not include skim milk and buttermilk.

³ Fiscal years prior to 1931.

¹ As from 1932 the values include exchange equalization. ² 1887. ³ 1898. ⁴ 1889. ⁵ Shown for 1871. ⁶ 1874. ⁷ 1892. ⁸ Includes other items not specified. ⁹ 1886. ¹⁰ Years ended Sept. 30. ¹¹ The statistics of manufactures in 1871, 1881 and 1891 include all establishments irrespective of the number of employees. From 1901, statistics are for establishments with five hands or over. The figure shown for census years prior to 1921 are for the preceding year. From 1922, statistics are exclusive of construction, hand trades, repair and custom work. Figures for 1931-50 include non-ferrous metal smelting not included earlier years. ¹² Since 1924 the net value of production is computed by subtracting the cost of fuel and ele

PART I.—GEOGRAPHY*

Canada comprises the whole northern part of the North American Continent, except for the territory of Alaska. The most easterly point is Cape Spear, Newfoundland, at west longitude 52° 37', and the most westerly point is Mount St. Elias, Yukon, at west longitude 141°. The southernmost point is Middle Island in Lake Erie at north latitude 41° 41' and northward Canada extends to the North Pole and includes the Arctic Archipelago between Davis Strait, Baffin Bay and the connecting waters northward to and along the 60th meridian on the east and the 141st meridian on the west. Thus Canada covers in all 48° of latitude and 88° of longitude. It is bounded on the west by the Pacific Ocean and the 1,539.8 linear miles of Alaskan territory, on the south by the United States, a distance of 3,986.8 miles, and on the east by the Atlantic Ocean, Davis Strait and the dividing waters between Ellesmere Island and the Danish territory of Greenland.

Canada is the second largest country in the world, having an area of 3,845,774 sq. miles. It is superseded in size only by the Union of Soviet Socialist Republics with 8,598,679 sq. miles.† Other comparisons are: China 3,759,181 sq. miles,† continental United States and Alaska 3,608,644 sq. miles,† the Continent of Europe (excluding the European part of the Soviet Union) 1,913,126 sq. miles† and Australia 2,974,463 sq. miles.†

The sea-coast of Canada comprises the following estimated mileages:—

Mainland.—Atlantic 6,111, Pacific 1,579, Hudson Strait 1,245, Hudson Bay 3,157, Arctic 5,771; total 17,863 miles.

Islands.— Atlantic 8,677, Pacific 3,979, Hudson Strait 60, Hudson Bay 2,307, Arctic 26,786; total 41,809 miles.

* Revised by the Geographical Branch, Department of Mines and Technical Surveys, Ottawa.

† Taken from the United Nations Statistical Year Book, 1949-50.

Canada's fresh-water area is extensive, constituting over 6 p.c. of the total area of the country. Its inland waterways, particularly with respect to transportation and the development of electric power, are among the most vital influences in the national economy.

1.—Approximate Land and Fresh-Water Areas, by Provinces and Territories

NOTE.—For a classification of land area as agricultural, forested, etc., see p. 19.

¹ Based on estimates.

Section 1.—Physical Geography

Subsection 1.—Physiographic Divisions

Canada divides naturally into four major physiographic regions which are differentiated by geological history and structure. They include the Canadian Shield, the Appalachian Region, the Interior Plains Region and the Cordilleran Region. A fifth division, about which much less is known, includes a belt of folded rocks of Palæozoic and Mesozoic age in the northern part of the Arctic Archipelago. The following is a short description of these regions from the standpoint of topography and geology.

The Canadian Shield.—The Canadian Shield is a vast V-shaped area of approximately 1,800,000 sq. miles surrounding Hudson Bay and extending from the coast of Labrador west to the Interior Plains Region and south to the International Border. It is an area, for the most part, of low relief rarely rising more than 1,500 to 2,000 feet above sea-level, except in Labrador where altitudes of 5,000 feet occur. Its surface is hummocky, marked by irregular hills and ridges but these, over wide areas, do not rise more than 100 to 200 feet above the adjacent lakes and valleys. The numerous lakes and rivers which are everywhere so characteristic of the Shield—for it is the great lake region of the world, probably containing more lakes than all the rest of the world put together—were formed during the Glacial or Pleistocene period as the result of erosion and deposition by continental glaciers which covered the region during the Pleistocene epoch.

One of these ice sheets gathered west of Hudson Bay, another in the heart of Labrador. From these centres the ice moved out in all directions and in its advance scoured off the residual soil, smoothed down the topography, polished and striated rock surfaces and, by scattering debris irregularly, completely disorganized the drainage. The result was the formation of thousands of lakes of all sizes and shapes. In some of the temporary lakes situated in front of the ice during its retreat, clay and other fine stratified deposits accumulated forming what are known as clay belts.

Geologically, the rocks of the Shield are all very old having been formed in Precambrian time but include sedimentary, volcanic and intrusive varieties of widely different ages. In succeeding eras, the Shield suffered vertical movement at intervals but it has been unaffected by folding or mountain-building deformation. The Canadian Shield is a great storehouse of mineral wealth, particularly of metals. Its gold ores, the copper-zinc-sulphide replacement deposits of Noranda, Flin Flon, etc., and many other ore-occurrences were formed by mineralization given off by intrusive masses during the late stages of their cooling. In eastern Ontario and western Quebec, where granite has intruded limestone and other sediments, there occur deposits of mica, graphite, feldspar, magnesite, fluorite and other minerals.

The Appalachian Region.—This Region includes the Provinces of Nova Scotia, New Brunswick, Prince Edward Island, the Island of Newfoundland and that part of Quebec lying south and east of the St. Lawrence River. It is mountainous or hilly, the highest elevation—4,200 feet—is that of Mount Jacques Cartier on Tabletop Mountain, in the Shickshock Range in central Gaspé.

The rocks of this Region include sediments, volcanics and intrusives chiefly of Palæozoic age with rocks of Precambrian age in local areas on the Island of Newfoundland, New Brunswick, Cape Breton Island and southwestern Quebec. Ordovician strata in Newfoundland contain important deposits of iron. Rocks of Carboniferous age have large coal deposits and also gypsum. Zinc, lead and copper are mined at Red Indian Lake in Newfoundland and other mineral occurrences are known.

The Interior Plains Region.—The Interior Plains are part of the great plains region in the interior of the continent and, in Canada, extend through Manitoba, Saskatchewan, and Alberta northwest to the Arctic Ocean. Other areas, such as the St. Lawrence Lowlands stretching from Lake Huron northeasterly to Anticosti Island and the Hudson Bay Lowland bordering the west side of Hudson Bay, are regarded as outliers of this Region.

The Plains of Western Canada slope gently eastward from an elevation of 4,000 feet in western Alberta to about 500 feet in southern Manitoba; they show a flat surface interrupted by deep-incised valleys and by many flat-topped hills or mesas. Glacial deposits particularly clays laid down in glacial Lake Agassiz, which existed during the late stages of the melting of the Pleistocene ice sheet, are responsible for the soils that produce the wheat crops of Manitoba and Saskatchewan.

The border of the Mesozoic strata in Manitoba and Saskatchewan is a steep rise known as the Manitoba Escarpment. Westward the surface rises from 1,000 to 2,000 feet at the escarpment to 4,000 to 5,000 feet at the border with the mountains of the Cordilleran region. Bituminous coal, lignites, natural gas and bituminous

sands are found in these beds in Alberta and Saskatchewan, and gypsum and salt in Palæozoic strata in Manitoba. Devonian beds produce the important oil fields of Alberta and Norman Wells in the Mackenzie Valley, N.W.T.

The St. Lawrence Lowland falls into three subdivisions, the first and most westerly includes Manitoulin Island and that part of Ontario facing on Lakes Erie and Ontario. It shows a prominent topographical feature, the Niagara Escarpment, an abrupt rise of 250 to 300 feet extending from the Niagara River to Bruce Peninsula. The second subdivision extends from the east side of the Frontenac axis (a southward projection of the Canadian Shield that crosses the St. Lawrence River between Kingston and Brockville, Ont.) east to Quebec City, and the third subdivision comprises Anticosti Island and the Mingan Islands.

The strata of the entire belt of the St. Lawrence Lowlands are of Palæozoic age. They lie horizontally or with low dips, are mainly of marine origin, and were deposited in seas that swept over a large part of the continent. Vertical movements caused these seas to advance and retreat so that the sediments deposited vary considerably. On Anticosti Island the rocks are of Upper Ordovician and Silurian age. The mineral occurrences in the St. Lawrence Lowlands are petroleum and natural gas, salt, gypsum, limestone, dolomite and also clay which can be used for the manufacture of bricks, tiles and cement.

The Hudson Bay Lowland, the other outlier of the Interior Plains, is underlain by flat-lying rocks mostly of Palæozoic age ranging from Ordovician to Devonian. It rises from sea-level with a very gradual gradient to a height of 400 feet. Lignite occurs in the Moose River Basin in beds of Upper Jurassic or Lower Cretaceous age overlying the Devonian beds.

The Cordilleran Region.—The Cordilleran Region comprises the mountainous country bordering the Pacific Ocean and covers an area of 600,000 sq. miles. It is made up of three zones. On the east is the Rocky Mountain Range, on the west along the coast is the Coast Range, and between the two is a third belt made up of upland and mountainous country.

The Rocky Mountains have a maximum width of 100 miles and peaks and elevations of from 10,000 to 12,000 feet. The Coast Range varies in width from 50 to 100 miles and rises abruptly from the coast to peaks of from 7,000 to 10,000 feet.

The northern part of the interior belt, known as the Yukon plateau, is a gently rolling upland broken into a series of flat-topped ridges by valleys several thousand feet deep; the southern part in British Columbia, rises from 3,000 to 4,000 feet above sea-level. To the east between the upland and the Rocky Mountains are a series of mountain ranges, the Selkirks with peaks of 11,000 feet being the most important.

The geological history of the Cordilleran is complex but may be summarized as follows. In Precambrian time sediments which are now in the form of limestones, gneisses and schists were deposited in the interior belt. In Yukon, these strata are known as the Yukon group and in central British Columbia as the Shuswap group. These have been altered by intrusive rocks and included with them are the

metamorphosed phases of much later rocks. In late Precambrian time argillites and related sediments accumulated on the site of the southern Rockies and in the region now occupied by the Purcell Mountains which are made up dominantly of quartzites of a thickness of over 20,000 feet. Sedimentation progressed during the Palaeozoic era from Cambrian to Carboniferous time, and also during that of Mesozoic. Volcanism, the intrusion of granites, and mountain-building took place in the western part of the belt during the Jurassic period giving rise to the Selkirk and Coast Ranges. In late Cretaceous time and continuing over into the Tertiary, pressure from the west folded the rocks in the eastern part of the region giving rise to the Rocky Mountains.

The Cordilleran Region is a producer of gold (both lode and placer), silver, lead and zinc, and contains deposits also of mercury, tungsten and iron. Most of the known mineral occurrences are in the Western Cordilleran Belt and are related to late Mesozoic and early Tertiary granitic intrusions. Coal is widespread in the foothills of Alberta and oil and petroleum are also found in this area. Fluorite, gypsum, magnesite, hydromagnesite phosphate, saline deposits, and limestone form other valuable mineral occurrences.

For further details see Year Book 1947, pp. 19-29, and Year Book 1951, pp. 14-26.

Subsection 2.—Hydrographic Features

Lakes and Rivers.—Canada's fresh water lakes and rivers cover an area of 235,677 sq. miles. The outstanding lakes are, of course, the Great Lakes, though only part of these are in Canadian territory. The International Boundary between Canada and the United States passes through Lakes Superior, Huron, St. Clair, Erie and Ontario. Details are given in Table 2.

2.—Areas, Elevations, and Depths of the Great Lakes

Lake	Elevation Above Sea-level	Length	Breadth	Maximum Depth	Total Area	Area on Canadian Side of Boundary
	ft.	miles	miles	ft.	sq. miles	sq. miles
Superior.....	602.23	383	160	1,302	31,820	11,200
Michigan (U.S.A.).....	580.77	321	118	923	22,400	—
Huron.....	580.77	247	101	750	23,010	13,675
St. Clair.....	575.30	26	24	23	460	270
Erie.....	572.40	241	57	210	9,940	5,094
Ontario.....	245.88	193	53	774	7,540	3,727

There are no tides in these Great Lakes although considerable variation in water-levels is occasioned by strong winds or heavy precipitation.

Other large lakes of Canada, ranging in area from 9,000 to 12,000 sq. miles, are Lake Winnipeg, Great Slave Lake and Great Bear Lake. Apart from these, notable for size, there are innumerable lakes scattered over that major portion of Canada lying within the Canadian Shield. In an area of 6,094 sq. miles, accurately mapped, south and east of Lake Winnipeg, there are 3,000 lakes. In an area of 5,294 sq. miles accurately mapped southwest of Reindeer Lake in Saskatchewan, there are 7,500 lakes.

3.—Areas and Elevations of Principal Lakes, by Provinces and Territories

NOTE.—Areas given are for mean water levels. In the case of those reservoirs and lakes for which two elevations are given, HW means high water, LW low water, and N normal level.

¹ Areas are approximate and are exclusive of those portions of the basins of all rivers that lie in United States territory.

In Eastern Canada, the Great Lakes and St. Lawrence drainage basin dominates all others and forms an unequalled system of navigable inland waterways through a region rich in natural and industrial resources. From the head of Lake Superior to the entrance of the Gulf of St. Lawrence, the distance is 2,338 miles. The St. Lawrence waterway and its tributaries, most of which have lakes available for reservoiring, have very large developed and potential power resources.

The greater part of Canada drains into Hudson Bay and the Arctic Ocean; the Nelson River drainage is exceptional in running *through* the most arable and the most settled part of Western Canada, but otherwise the rivers of the West, east of the Rockies, run *away* from the settled areas towards the cold northern salt waters and this adversely affects their industrial utility. The Mackenzie River, which drains Great Slave Lake, is, with its headwaters, the longest river in Canada (2,635 miles) and its valley constitutes the natural transportation route through the Northwest Territories down to the Arctic Ocean. From Fort Smith, on the Slave River, large river boats run without any obstruction down to Aklavik in the delta of the Mackenzie, a distance of 1,292 miles. Table 5 gives the lengths of the principal rivers with their tributaries classified according to the four major drainage basins.

5.—Lengths of Principal Rivers and Tributaries

NOTE.—In this table the tributaries and sub-tributaries are indicated by indentation of the names. Thus the Ottawa and other rivers are shown as tributary to the St. Lawrence, and the Gatineau and other rivers as tributary to the Ottawa.

Ocean Areas and Seas.—A comprehensive description of the oceanic areas and seas of Canada would include sciences such as oceanography, marine biology and meteorology. However, the basic factor in any study of the oceanic-continental margin is the physical relief of the sea-floor and the scope of the information presented here is, therefore, restricted to this and a few salient features of the Atlantic, Arctic and sub-Arctic and Pacific marginal seas surrounding Canada. For further details, see Year Book 1947, pp. 3-12.

Atlantic.—Incursions of the sea in the Atlantic coast are formed in depressions between crests of the Appalachian Mountain system as it dips to the ocean. The submerged Continental Shelf, protruding seaward from the shore, effects the transition from continental to oceanic conditions. This Shelf is distinguished by great width and diversity of relief. From the coast of Nova Scotia its width varies from 60 to 100 miles, from Newfoundland 120 to 50 miles (at the entrance of Hudson Strait), and northward it merges with that of the Polar Sea. The outer edge of the Shelf, known as the Continental Shoulder, is of varying depths of from 100 to 200 fathoms before the Shelf suddenly gives way to the steep declivity leading to abyssal depths. The over-all gradient of the Atlantic Continental Shelf is slight but the whole area is studded with shoals, plateaux, banks, ridges and islands and the coasts of Nova Scotia and Newfoundland are rugged and fringed with islets and shoals. Off Nova Scotia the 40-fathom line lies at an average of 12 miles from

the shore and constitutes the danger line for coastwise shipping. The whole sea-floor of the marginal sea appears to be traversed by channels and gulleys and is trenched with deep ravines cutting well into the Shelf.

The main topographical features of the Atlantic marginal sea-floor are attributed to glacial origin but land erosion is an important factor. Eroded materials are carried seaward by rivers, ice and wind, and wave action against cliffs and shore banks washes away enormous masses that are deposited over the surrounding sea-floor. Icebergs carry detritus gouged from the land and brought south by the Labrador Current. The conformation of the continental sea-floor is, therefore, constantly changing and navigation charts of Canada's eastern seaboard must be continuously revised.

Arctic and Sub-Arctic.—The submerged plateau protruding from the northern coast of North America is a major part of the Great Continental Shelf surrounding the North Polar Sea on which lie all the Arctic Islands of Canada, Iceland, Greenland and most of those of Europe and Asia. The Polar Shelf develops its maximum width on the 80th meridian of west longitude where it extends from the south of James Bay to the north coast of Ellesmere Island, a distance of over 2,000 miles.

The floor topography of this continental margin is somewhat hypothetical but sufficient has been charted to indicate an abrupt break at the northern oceanward edge. This steep continental terrace borders the whole western side of the Canadian Archipelago and constitutes one of the most striking and significant features of the Polar regions. From this declivity deep well-developed troughs, cut by glaciers, enter between the western group of islands. A ridge across Davis Strait on which the depth is about 200 fathoms separates this basin from the open Atlantic.

The incursions of the sea—Hudson Bay and Hudson Strait—bite deeply into the continent; the former is an inland sea 250,000 sq. miles in area. Soundings of Hudson Bay show an average depth of about 70 fathoms, the greatest charted depth in the centre of the Bay is 141 fathoms.

Hudson Strait separates Baffin Island from the continental coast and connects Hudson Bay with the Atlantic Ocean. It is 430 miles long and from 37 to 120 miles in width and its greatest charted depth of 481 fathoms is close inside the Atlantic entrance. Great irregularities of the sea floor are indicated but, except in inshore waters, few navigation hazards have been located.

Pacific.—The marginal sea of the Pacific differs strikingly from the other marine zones of Canada. The hydrography of British Columbia is characterized by bold, abrupt relief—repetition of the mountainous landscape. Numerous inlets penetrate the mountainous coast for distances of 50 to 75 miles. They are usually a mile or two in width and of considerable depth, with steep canyon-like sides. From the islet-strewn coast, the Continental Shelf extends from 50 to 100 sea-miles to its oceanward limit where depths of about 200 fathoms are found. There the sea-floor drops rapidly to the Pacific Deep, parts of the western slopes of Vancouver and Queen Charlotte Islands lying only four miles and one mile, respectively, from the edge of the declivity. These great detached land-masses are the dominant features of the Pacific marginal sea. Along the whole coast continuous navigation is afforded through an inside passage sheltered from the sea by a protective barrier of islands. As is to be expected in a region so irregular in hydrographic relief, shoals and pinnacle rocks are numerous, necessitating great caution in navigation.

Subsection 3.—Islands

The northern and western coasts of Canada are skirted by clusters of islands. Those on the north include a very large group within the Arctic Circle. On the west coast, Vancouver and the Queen Charlotte Islands are the largest and most important but the coast is studded with many small rocky islands.

The Island of Newfoundland forming part of the Province of Newfoundland, the Province of Prince Edward Island, Cape Breton Island forming part of the Province of Nova Scotia, Grand Manan and Campobello Islands forming part of the Province of New Brunswick, Anticosti Island and the Magdalen group included in the Province of Quebec are the chief islands off the eastern coast.

The most important islands of the inland waters are Manitoulin Island, 1,068 sq. miles in area, lying in Lake Huron, the so-called Thirty Thousand Islands of Georgian Bay and the Thousand Islands in the outlet from Lake Ontario into the St. Lawrence River.

Table 6 lists the islands of Canada that have an area of over 2,000 sq. miles.

6.—Areas of Principal Islands

¹ This peak is on the interprovincial boundary between Alberta and British Columbia.

² This peak is on the interprovincial boundary between British Columbia and Alaska.

³ All the listed peaks are on or near the Yukon-Alaska Boundary.

Section 2.—Economic Geography

Politically, Canada is divided into ten provinces and two 'territories'. Each of the provinces is sovereign in its own sphere, as set out in the British North America Act, 1867, and its amendments, and as new provinces have been organized they have been granted political status equivalent to that of the original provinces. Yukon and the Northwest Territories with their boundaries of to-day are administered by the Federal Government. The characteristics of each of the provinces and of the territories are reviewed below. Details of resources and their development are given in later chapters.

Newfoundland.—Newfoundland, once the oldest colony of the British Empire, is the newest and most easterly province of Canada. It comprises the Coast of Labrador, an area of 112,630 sq. miles on the mainland, and the Island of Newfoundland which lies across the Gulf of St. Lawrence. Separating the two portions is the Strait of Belle Isle, 11 miles in width at its narrowest point. From Nova Scotia across Cabot Strait the distance is 70 miles. The Island is triangular in shape, the three sides each being about 320 miles long, and it has an area of 42,734 sq. miles.

The climate of the Island is temperate, with cool summers, mild winters and evenly distributed rainfall. In Labrador climatic conditions are more severe.

The Island is a plateau of low, rolling relief, with its highest elevations in the west where summits in the Long Range Mountains exceed 2,500 feet. Much of the surface is barren and rocky with innumerable ponds and swamps, and the land is unsuitable for farming. The river valleys and the west coast are thickly forested and support a thriving wood-pulp industry. The deeply indented coast line has many harbours providing safe anchorage for the fishing vessels that support the important fishing industry. Fishing, mainly for cod, is carried on along the coasts of Newfoundland and Labrador and on the Grand Banks. The Province of Newfoundland has extensive mineral deposits. Iron ore is mined on Bell Island and lead-zinc-copper ore at Buchans in the interior of the Island, while the vast iron-ore and water-power resources of the Coast of Labrador are now in the first stages of development.

Prince Edward Island.—This, the smallest province of Canada, is about 120 miles in length, with an average width of 20 miles and an area of 2,184 sq. miles. Prince Edward Island lies 10 to 20 miles off the mainland, east of New Brunswick and north of Nova Scotia, and is separated from these provinces by Northumberland Strait.

The Island attains an altitude of about 450 feet above sea-level and is almost trisected by the deep indentations of Malpeque Bay and by the mouth of the Hillsborough River, which nearly meets Tracadie Bay on the north side. Its rich, red soil and red sandstone formations are distinctive features. The climate is tempered by the surrounding waters of the Gulf of St. Lawrence and, combined with fertile soil and sheltered harbours, offers great inducements to the pursuits of agriculture and fishing. The Province is noted for its production of seed potatoes, its lobster canneries, oyster beds and fur farms.

Nova Scotia.—The Province of Nova Scotia is 381 miles in length by 50 to 105 miles in width and has an area of 21,068 sq. miles almost surrounded by the Bay of Fundy, the Atlantic Ocean and the Gulf of St. Lawrence. The mainland is connected with the Province of New Brunswick by the Isthmus of Chignecto. The Island of Cape Breton, forming the northeast portion of the Province, is separated from the mainland by the narrow Strait of Canso and includes the famous salt-water Bras d'Or Lakes. On the Atlantic side, the mainland is generally rocky and open to the sweep of Atlantic storms, it is deeply indented and has numerous harbours providing safety for the large fishing fleets that support the extensive fishing industry of the Province. The slopes facing the Bay of Fundy and the Gulf of St. Lawrence are sheltered from the Atlantic by low mountainous ridges not exceeding an altitude of 1,500 feet and running through the centre of the Province. In striking contrast to the rocky Atlantic side, they present fertile plains and river valleys especially adapted by climate and situation to the growth of apples, pears and other fruits.

Nova Scotia is one of the leading provinces in the production of good-quality bituminous coal, which is well adapted to the production of coke and excellent for domestic use and for steam-raising purposes. The chief coalfields are at Sydney and Inverness on Cape Breton Island, and at Pictou and Cumberland on the mainland.

New Brunswick.—New Brunswick is nearly rectangular in shape with an area of 27,985 sq. miles. The Bay of Chaleur on the north, the Gulf of St. Lawrence and Northumberland Strait on the east, the Bay of Fundy on the south, and

Passamaquoddy Bay on the southwest, provide the Province with a very extensive sea-coast. It adjoins the State of Maine, U.S.A., on the west and the Province of Quebec on the north and northwest.

The surface of New Brunswick is mostly undulating, but to the east it attains its highest elevation of 2,690 feet in the vicinity of Grand Falls, on the St. John River. In the northeastern half of the Province extensive areas of Crown lands carry valuable stands of merchantable timber and numerous rivers provide access to the extensive lumbering areas. The Province is watered to the west and south by the St. John River, which, in its course of 400 miles, runs through country famed for its distinctive beauty.

Economically, the forest resources are of first importance followed by the fisheries, although large areas of rich agricultural land are found in the numerous river valleys, especially that of the lower St. John, and in the broad plains near the coast. The mineral resources of the Province are limited and include moderate amounts of coal, natural gas and petroleum.

Quebec.—Quebec is the largest province of Canada and occupies the area of North America directly east of Hudson Bay, with the exception of the four other Atlantic Provinces; adjoining it on the south are the United States and New Brunswick, with Ontario on the west. It has an area of 594,860 sq. miles. A large part of the surface is made up of Precambrian rocks of the Canadian Shield, which renders it unsuitable for agriculture. The Gulf of St. Lawrence and the River St. Lawrence penetrate the entire width of Quebec and divide the Eastern Townships and the Gaspé Peninsula to the south from the larger area of the Province to the north. North of the St. Lawrence the land takes the form of a ridge parallel to the river and rises from sea-level to the Height of Land (varying from 1,000 to 3,000 feet) from which it descends gently to sea-level at Hudson Bay and Hudson Strait.

With the exception of the treeless zone, extending north of latitude 58°, most of the Province supports a valuable tree growth varying from the mixed forests in the southwest to the coniferous forests in the east and north. In addition to extensive timber limits, which form the basis of a great pulp and paper industry, Quebec is the foremost of the provinces in the development of hydro-electric power and has available water-power resources, at ordinary minimum flow, almost equal to those of Ontario and Manitoba combined. Asbestos deposits of Quebec have long been known for their quality and extent, and extensive developments of gold and copper have taken place in the western part of the Province. Year by year the mineralized area is being extended and Quebec is now in second place in mineral production among the provinces. The fisheries in the St. Lawrence River and Gulf are important and inland waters abound in game fish. The climate and soil of the upper St. Lawrence Valley and of the Eastern Townships are well suited to general farming operations, including dairying and the production of vegetables and maple products on a commercial basis.

Ontario.—Lying between Quebec on the east and Manitoba on the west, Ontario has an area of 412,582 sq. miles and is usually regarded as an inland province but its southern boundary has a fresh-water shore line of 2,362 miles on the Great Lakes while its northern limits have a salt-water shore line of 680 miles on Hudson and James Bays. There is a tidal port at Moosonee at the southern end of James Bay.

The surface of Ontario is characteristic of the Canadian Shield, except in the southern triangle lying between the lower lakes and the Ottawa River where the surface is low and level. The highest point in Ontario is 2,120 feet, on the promontory at the northeastern corner of Lake Superior. Northwest from the Height of Land, the slope descends very gently to Hudson Bay where a large marginal strip (the Hudson Bay Lowlands) is less than 500 feet above sea-level.

Mining is a very important industry in the wide-spread Precambrian area. Although the Province is lacking in native coal it is rich in other minerals and contributes almost one-half of the total mineral production of Canada. Gold, silver, nickel, copper, zinc, magnesium, dolomite, gypsum, salt and other minerals are mined extensively and petroleum and natural gas are also found in the Ontario Peninsula.

The Great Lakes waterways system permits economic international transportation of iron ore and coal for Ontario's basic iron and steel industries. This advantage, together with an abundance of natural resources has made Ontario the foremost manufacturing province of Canada. Vast forest resources in proximity to hydro-power form the basis of a large pulp and paper industry, while the forests of the north are a rich fur preserve.

The lands along the St. Lawrence possess excellent soil and general farming is carried on extensively. In the Niagara Belt, fruit farming has been scientifically developed into a highly specialized industry.

Manitoba.—Manitoba, covering 246,512 sq. miles, is the most central of the provinces. With the Provinces of Saskatchewan and Alberta, it constitutes the Prairie Belt or Interior Plains section of Canada—world-renowned for the quality of its wheat.

Manitoba is a land of wide diversity, combining 400 miles of sea-coast on a rocky belt along its northeastern boundary, bordering Hudson Bay, great areas of northern mixed forests, large lakes and rivers covering an area of 26,789 sq. miles, a belt of treeless prairie extending to the southeastern corner of the Province, and patches of open prairie overlain by very fertile soil of great depth. The surface of the Province as a whole is comparatively level, the average elevation being between 500 and 1,000 feet. The greatest height of 2,727 feet is Duck Mountain northwest of Lake Dauphin.

About three-fifths of the Province, east and north of Lake Winnipeg, is underlain with Precambrian rock in which the presence of rich deposits of base metals has been confirmed. The Province, although regarded basically as agricultural, possesses a wealth of mineral, forest and water-power resources which have brought about an expanding industrial development.

Saskatchewan.—Saskatchewan, 251,700 sq. miles in area, lies in the centre of the Prairie Belt between Manitoba and Alberta and extends, as do those provinces, from the International Boundary on the south to the 60th parallel of latitude on the north.

The Canadian Shield extends over the northern third of the Province; this portion is abundantly watered by lakes and rivers and is generally of low relief. This area is also rich in timber resources and has given evidence of potential richness of mineral wealth. The southerly two-thirds of the Province is, generally, fertile prairie with soil of great depth. In normal years there is sufficient moisture for rapid growth and the abundant sunshine during the long summer season in this northern latitude quickly ripens the crops.

Alberta.—This Province covers 255,285 sq. miles and lies between Saskatchewan and the Rocky Mountains. The southern part of the Province is in the dry, treeless prairie belt, changing to the north into a zone of poplar interspersed with open prairie and giving way to mixed forests. The Canadian Shield extends only into the northeast corner of Alberta so that, excepting the fringe of mountainous country on its western border, practically the whole of the Province is overlain by arable soil of great depth. Alberta has two marked physical features: (1) the great valley of the Peace River where settlement has extended farther north than in any other part of Canada; and (2) the grazing lands in the foothills district which, rising sharply on the west, commence the ascent that continues to the very peaks of the Rocky Mountains. The southern half of the Province, rising towards the west, lies at a general elevation of from 2,000 to 4,000 feet but, in the northern half, the slope descends until elevations of well under 1,000 feet are reached at Lake Athabaska in the northeast corner.

Alberta has the most extensive coal and oil resources of any of the provinces and is the leading producer of petroleum and natural gas. These resources provide the basis of Alberta's industrial development. Lumbering is important in the more mountainous western parts and in the north, and ranching is carried on in the less populous sections. In some southern prairie areas the quantity and distribution of the natural precipitation make permanent agriculture precarious and a number of large irrigation projects have been developed, taking their water supply from rivers rising in the mountains that form the western boundary of the Province. The climate of Alberta is a particularly pleasant one, cooler in summer than the more eastern parts of the country and tempered in winter by the chinook winds.

British Columbia.—British Columbia, 366,255 sq. miles in area, is the third largest and the most westerly province of Canada. It includes many islands of the Pacific, notably Vancouver Island and the Queen Charlotte Islands, the area of the former being about 12,408 sq. miles.

The predominant feature of the Province is the parallel ranges of mountains that cover all except the northeast corner and produce a conformation characterized by high mountain ranges interspaced with valleys, many of which are extremely fertile with climatic conditions well adapted to mixed agriculture or fruit growing. Generally, the agricultural areas of these valleys are relatively small and broken, but there are two large areas in the Peace River Block and the Stuart Lake District that are rich and have great agricultural possibilities. The shore line of the Pacific is deeply indented with many inlets which are ideal for harbourage.

The wealth of the forest resources supports the lumbering and pulp and paper industries and places British Columbia first among the provinces in the production of lumber and timber. The Province excels in fishery products, chiefly on account of the famous Pacific salmon. The mineral resources are remarkable for their variety and wealth. Production of gold, copper, silver, lead and zinc has played an important role in the economic life of the Province since its early days, while valuable coal deposits on Vancouver Island and at Crowsnest and Fernie in the interior have been worked for many years. In water-power resources, British Columbia ranks second in Canada.

Yukon and the Northwest Territories.—These vast northern territories extend over an area of 1,511,979 sq. miles, about 39 p.c. of the surface of Canada, from the 60th parallel of latitude to its northernmost limits.

The Territories are areas of contrast and extremes in physical characteristics, flora and fauna, and climate. The physical characteristics vary from the treeless plains of the far north, the rolling hills of the Canadian Shield in the east, the forested valley of the Mackenzie River, to some of the highest peaks of the Cordilleran Range in the west; from the small streams and lakes to the longest rivers in Canada, the Mackenzie and the Yukon, both of which are approximately 2,000 miles long, and Great Slave and Great Bear Lakes, each of which is over 11,000 sq. miles in area.

The mountains are rich in minerals and many valuable mining properties have been developed for gold, silver, oil and natural gas. The shores of Great Bear Lake have important deposits of high-grade pitchblende ores.

Early maturing varieties of spring wheat are grown on the agricultural land of the Territories lying almost entirely in the extension into the Mackenzie Valley of the central plains of the Prairie Provinces. In the northern regions the flora and fauna have their own peculiar patterns. Immense areas of lichens, which at first sight appear to be stretches of broken greyish rock, are the pastures upon which muskoxen feed. Caribou and muskoxen also feed on crowberries, ground-willow, sedges and mosses in the summer and on the living roots of these plants in winter.

The winters along the Mackenzie River are bitterly cold, averaging 16° to 25° below zero, but in Yukon they are surprisingly mild, being modified by Pacific waters, and vary from 2° below to 21° below zero.

Hunting of seals, walrus and whales and fishing and trapping form the principal basis of existence for the native Eskimos, providing food and hides for the manufacture of clothing, sleeping bags, etc. The introduction of reindeer by the Federal Government in the Mackenzie District of the Northwest Territories has provided an important industry to serve the people's needs.

PART II.—LAND RESOURCES AND PUBLIC LANDS

Section 1.—Land Resources

Table 1 classifies the land resources as agricultural, forested and unproductive. Duplication is unavoidable between the totals of present and potential agricultural land and the totals of forested land to the extent of agricultural lands under forest. The figures of agricultural lands are based on the 1951 Census; those on forested land are obtained from the Department of Resources and Development while those for total land area of Canada and the provinces are supplied by the Surveyor General.

1.—Land Area, classified as Agricultural, Forested or Unproductive, (circa) 1951

Description	New- found- land	Prince Edward Island	Nova Scotia	New Brun- swick	Quebec	Ontario	Mani- toba	Saska- tchewan	Alberta	British Columbia	Yukon and N.W.T.	Canada

¹ Less than one square mile
² For purposes of this table, the unoccupied agricultural land of Newfoundland (figures for which are unavailable) is presumed to be nil.
³ Agricultural land of all classes and land that has agricultural possibilities in any sense.
⁴ Total agricultural land plus forested land minus forested agricultural land.
⁵ Includes open muskeg, rock, road allowances, urban land, etc.

NOTE.—Totals, Forested Land excludes forested land of Labrador.

Canada's extensive areas of arable and forested land, together with its vast water-power resources, are the basis of its industrial and commercial life. Agricultural land has been developed on a substantial scale and is well distributed from east to west. It is characterized by a diversity of contour, soil and climate and is thus capable of producing a great variety of crops in a volume well beyond domestic requirements. Of the total land area, 15.3 p.c. is estimated as suitable for cultivation and of this area a little less than 50 p.c. is, at present, occupied. Most of the unoccupied land considered potentially suitable for agriculture is now under forest. Altogether, about 36 p.c. of the total land area of the country is forested. This vast extent is of immense importance, not only in the production of lumber, pulpwood and fuel, but also in tempering the climate and conserving the water supply.

The above treatment of lands resources is concerned only with those summary phases of the subject that can be regarded as falling under the definition of physiography used in its wider interpretation. Detailed information regarding individual natural resources and their development will be found in later chapters, together with data concerning the efforts directed to conservation of those resources.

Section 2.—Public Lands

In Table 2, classifying the land area of Canada by tenure, items 2, 3 and 4 are obtained from Federal Government sources and items 1, 5 and 6 from Provincial Government sources.

2.—Land Area Classified by Tenure, (circa) 1952

Tenure	Nfld.	P.E.I.	N.S.	N.B.	Que.	Ont.
	sq. miles	sq. miles	sq. miles	sq. miles	sq. miles	sq. miles

Totals, Land Area.....	219,723	237,975	248,800	359,279	1,458,784	3,610,697

¹ Excludes the coast of Labrador.

² Does not add to total for Canada due to fractions of sq. miles.

³ Includes the Gatineau Park (50 sq. miles) and the Quebec Battlefields Park (0.36 sq. miles) which are under federal jurisdiction but which are not technically National Parks.

⁴ Less than 1 sq. mile.

⁵ Includes 952,849 sq. miles set aside by Order in Council as native game preserves in which only Indians and Eskimos may hunt, as game sanctuaries in which hunting and trapping is otherwise forbidden, and as reserves for reindeer grazing, but which are not regarded as National Parks.

⁶ Includes Wood Buffalo Park (13,675 sq. miles) which, although reserved by the Federal Government, is not administered as a National Park.

⁷ That portion of Wood Buffalo Park in N.W.T.

⁸ Includes 1,392 sq. miles of unsurveyed lands—Provincial Park areas.

Subsection 1.—Federal Public Lands

Public lands under the administration of the Federal Government comprise lands in the Northwest Territories, including the Arctic Archipelago and the islands in Hudson Strait, Hudson Bay and James Bay, lands in Yukon Territory, Ordnance and Admiralty Lands, National Parks and National Historic Sites, Forest Experiment Stations, Experimental Farms, Indian Reserves and, in general, all public lands held by the several Departments of the Federal Government for various purposes connected with federal administration. The Dominion Lands Act, (R.S.C., 1927, c. 113) and the Ordnance and Admiralty Lands Act (R.S.C., 1927, c. 58) were repealed in 1950, while the Territorial Lands Act (14 Geo. VI, c. 22) and the Public Lands Grants Act (14 Geo. VI, c. 19) were enacted to replace them and became effective June 1, 1950.

The largest land areas under federal administration are the Northwest Territories and Yukon Territory amounting to about 1,458,784 sq. miles or 40 p.c. of the land surface of Canada. This part of the national domain, which is all north of the 60th parallel of latitude, is under the administration of the Northern Administration and Lands Branch of the Department of Resources and Development.

Recent Developments in the Northwest Territories.—The value of mineral production in the Northwest Territories in 1950 amounted to \$8,050,899 made up as follows: gold \$7,635,227, silver \$50,198, crude petroleum \$352,656, and natural gas \$12,818. During the year ended Mar. 31, 1951, 650 miner's licences and renewals and 1,023 quartz grants were issued, and assignments of mineral claims numbered 808. Record was made of 124 leases, comprising 6,617 acres, issued under the Quartz Mining Regulations. The mining inspection service was maintained under the Mines Safety Ordinance of the Northwest Territories.

X-ray diamond drilling was carried on in the Quyta-Giaque Lake area to evaluate the ore deposits. Prospecting and exploration, including 14,741 feet of diamond drilling, was conducted in the McKay-Courageous Lake region. The 490-foot shaft of an old property in the Indin Lake area was drained and 1,248 feet of underground development completed. Production of pitchblende concentrates continued in the Great Bear Lake area. Prospecting for uranium was carried on in the Hottah Lake and East Slave Lake areas and a 5,000-foot diamond-drilling program was begun at Stark Lake in the East Slave Lake area. Several claims were staked on the uranium-bearing ore located at Hottah Lake.

In 1951, a mine rescue station was opened at Yellowknife. The building includes a lecture room, storage for first-aid equipment, living quarters for the mine rescue superintendent and a double garage. The Department of Resources and Development provided \$26,500 for construction and \$8,500 for equipment and the mines assumed the balance of the construction costs and also maintenance expenses including the superintendent's salary.

During the 1951 season the Geological Survey of Canada, Department of Mines and Technical Surveys, had eight field parties carrying on mapping in the Carp Lake, Christie Bay and Fort Reliance areas, in southern Baffin Island and on Cornwallis Island.

During the year ended Mar. 31, 1951, 816 leases, licences, permissions to occupy, and agreements were in force, and 138 timber permits and 11 commercial timber berth permits were issued. The most important land transaction in 1951 was the transfer of 1,016 surveyed lots at Yellowknife Settlement to the Local Administrative District of Yellowknife, effective Jan. 6.

The Mackenzie District and Western Arctic were served by water transport during the navigation season and the all-weather Mackenzie Highway from Grimshaw, Alta., to Hay River was used extensively. Most settlements were served by aircraft carrying mail, passengers and freight, and radio communication through Government and private stations was maintained between settlements and outside points. The Government vessel, *C. D. Howe*, carried out its annual Eastern Arctic Patrol, transporting replacement personnel, mail and supplies as well as Government officers engaged in the study of Eskimo economy, food and health conditions, trade, family allowances, relief, old age allowances, education and vital statistics. The Department of Resources and Development provided the Canadian Handicrafts Guild with a grant of \$5,000 to organize handicraft work among the Eskimos. Carvings in stone, ivory and wood, and articles made of skins and furs are being successfully marketed.

Progress continued in forest conservation and wildlife protection. Regular patrols were conducted and modern fire-fighting equipment was provided from headquarters at Fort Smith. The program of aerial photography was continued by the Royal Canadian Air Force.

Commercial fishing in Great Slave Lake produced a catch of 6,813,706 lb. during the summer and winter seasons of 1950-51 and federal experimental sub-stations carried on field work in agriculture in the Mackenzie District. During the year ended June 30, 1951, fur production amounted to 643,579 pelts valued at \$2,038,339; 79 p.c. of the pelts taken were muskrat. Reindeer herds continued to be maintained in the Mackenzie Delta.

Recent Developments in Yukon Territory.—Yukon gold production in 1950 amounted to 93,339 fine oz. valued at \$3,551,549, an increase of 11,369 fine oz. over 1949. Silver production amounted to 3,202,779 fine oz. valued at \$2,588,486, lead 12,885,518 lb. valued at \$1,861,957, zinc 5,507,173 lb. valued at \$861,873, and cadmium 56,410 lb. valued at \$130,871.

In 1951, five field parties under the Geological Survey of Canada, Department of Mines and Technical Surveys, continued their investigations in connection with the production of a series of standard geological maps, reports on the main geological features, and detailed studies of certain areas. A mining inspection service was maintained under the Yukon Mining Safety Ordinance.

Leases, licences, permissions to occupy and agreements in effect in Yukon on Mar. 31, 1951, numbered 117, and during the fiscal year ended Mar. 31, 1951, 237 timber permits and 35 commercial timber berth permits were issued.

A railway connects Whitehorse with Skagway, Alaska, on the Pacific coast, and steamers ply the Yukon River and its tributaries. Aircraft service connects Yukon settlements with Vancouver and Edmonton, and bus services are provided on the Alaska Highway. A 246-mile all-weather gravel road was completed by the Federal Government in 1950 to connect the silver-lead mining area of Mayo with the Alaska Highway and railhead at Whitehorse. A similar type of road 58 miles in length was completed in 1950 as a joint project of the Federal and British Columbia Governments to give the gold mining settlement of Atlin, B.C., access to the Alaska Highway at Mile 867, Jake's Corner. These roads, with the exception of that portion of the Atlin Road lying within the Province of British Columbia, are maintained by the Territorial Government with federal financial assistance. Accommodation and roadside facilities are provided by private enterprise.

The program of aerial photography was continued on an enlarged scale by the Royal Canadian Air Force. The experimental substation maintained by the Department of Agriculture 100 miles northwest of Whitehorse on the Alaska Highway continued operations. Experiments with cereals and forage crops have been encouraging while poultry and cattle introduced on the substation in recent years have proved adaptable. During the year ended June 30, 1951, the fur take included 228,616 pelts valued at \$361,969.

Subsection 2.—Provincial Public Lands

Public lands of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia (except the Railway Belt and Peace River Block) have been administered since Confederation by the Provincial Governments. In 1930, the Federal Government transferred the unalienated portions of the natural resources of Manitoba, Saskatchewan, Alberta and of sections of British Columbia to their respective governments, and all lands in the Province of Newfoundland, except 6,680 sq. miles of alienated land and 2 sq. miles of Federal land, became provincial public lands under the Terms of Union on Mar. 31, 1949.

All land in the Province of Prince Edward Island, except 11 sq. miles under Federal administration, has been alienated.

Information regarding provincial public lands may be obtained from the respective provinces. (See the Directory of Sources of Official Information, Chapter XXVIII, under "Lands".)

Certain areas in most of the provinces have been set aside for parks and reserves; these are dealt with below.

Subsection 3.—National and Provincial Parks

The future of Canada in the field of outdoor recreation is being wisely provided for by the establishment of National and Provincial Parks. Many of these Parks are easily accessible by highway, rail or air and offer every type of accommodation from camping facilities to palatial hotels and cosy cabins. A wide variety of summer and winter recreational attractions are available in mountain, lakeland, woodland and seaside areas of exceptional scenic beauty.

The areas of the Parks are given in Table 3; location, year of establishment and main characteristics are given in Tables 4 and 5.

3.—Land Areas of National and Provincial Parks, by Provinces and Territories

Province or Territory	National	Provincial	Total
	sq. miles	sq. miles	sq. miles
Newfoundland.....	—	42.00	42.00
Prince Edward Island.....	7.00	—	7.00
Nova Scotia.....	390.61	—	390.61
New Brunswick.....	79.63	—	79.63
Quebec.....	0.33 ¹	12,000.00	12,000.33 ¹

Saskatchewan.....	1,496.00	1,685.13 ²	3,181.13
Alberta.....	20,718.00	14.00	20,732.00
British Columbia.....	1,671.00	14,081.00	15,752.00
Yukon.....	—	—	—
Northwest Territories.....	3,625.00	—	3,625.00
Canada.....	29,148.31¹	33,034.30	62,182.61¹

¹ Not including area of Gatineau Park, 50 sq. miles in extent (see p. 33).
 Lac La Ronge unsurveyed lands, 1,392 sq. miles in extent.

² Includes Nipawin and

National Parks.—From 1885, when the first National Park was established around the mineral hot springs at Banff, Alta., to 1951, 28 areas covering more than 29,000 sq. miles have been set aside as National Parks.

These Parks are maintained by the Federal Government for the protection of their flora, fauna and natural phenomena, for the preservation of their scenic beauties and interest and in some cases the marking of their historical significance in the building of the nation. They are supervised by the National Parks Branch, Department of Resources and Development, and are developed and maintained in such a manner as to provide perpetual inspiration, education and healthful recreation for present and future generations.

The National Parks are Canada's greatest single tourist attraction. Accommodation in privately owned hotels, bungalow cabins, chalets, lodges and cottages is available and modern cabins have been built in several of the Parks by the National Parks Administration to afford low-rental accommodation to Park visitors. Recreational facilities include heated, outdoor swimming pools with dressing-room buildings; equipped camp-grounds, some with trailer-park facilities; golf courses with superb scenic settings; tennis courts; bowling greens; well-equipped children's playgrounds; athletic fields; horseshoe pitches; outdoor checker-boards; and, in some of the Parks, amphitheatres where plays, concerts and picture shows are held in the open. For winter sports there are down-hill and slalom ski courses, ski jumps, ski tows and a chairlift.

A park warden service protects the forests and wildlife and maintains constant vigilance for the safety and comfort of visitors. Stocking and transfer of game fish in order to improve angling opportunities in Park waters are carried out extensively and successfully; fish hatcheries are operated in three of the mountain National Parks. Two of the Parks are largely big-game preserves where herds of buffalo and other animals find sanctuary.

In addition to the scenic, recreational and wild animal parks, Canada has eleven national historic parks. The National Parks and Historic Sites Service of the Department of Resources and Development is also responsible for the marking, preservation and restoration of places of great historic interest in Canada. More than 400 such sites have been marked on the recommendation of the Historic Sites and Monuments Board of Canada. Most important recent additions to the list of historic places transferred to National Parks administration are Lower Fort Garry in Manitoba, Fort Battleford in Saskatchewan, and the Citadel at Halifax, Nova Scotia.

4.—Location, Year Established, Area and Characteristics of National Parks

Park	Location	Year Estab- lished	Area	Characteristics
			sq. miles	
Scenic and Recreational Parks				
Banff.....	Western Alberta, on east slope of Rock- ies.	1885	2,564.0	Magnificent scenic playground containing noted resorts, Banff and Lake Louise. Mineral hot springs; summer and winter sports. Accessible by rail, highway and air. Hotel and bungalow cabin accom- modation. Equipped camp-grounds.

4.—Location, Year Established, Area and Characteristics of National Parks—continued

Park	Location	Year Estab- lished	Area	Characteristics
			sq. miles	
Scenic and Recrea- tional Parks—con.				
Yoho.....	Eastern British Col- umbia, on west slope of Rockies.	1886	507.0	Lofty peaks, magnificent waterfalls, colour- ful lakes. Yoho and Kicking Horse Valleys. Accessible by rail and highway. Hotel and bungalow cabin accommoda- tion. Equipped camp-grounds.
Glacier.....	Southeastern British Columbia, on sum- mit of the Selkirk Range.	1886	521.0	Superb alpine region, towering peaks, glaciers and forests. Accessible by rail only. Climbing, skiing, camping.
Waterton Lakes.....	Southern Alberta, adjoining Glacier Park in Montana, U.S.A.	1895	204.0	Canadian section, Waterton-Glacier Inter- national Peace Park. Mountain play- ground with spectacular peaks and charm- ing lakes. Accessible by highway. Hotel and bungalow cabin accommoda- tion. Equipped camp-grounds.
Jasper.....	Western Alberta, on east slope of Rockies.	1907	4,200.0	Mountain playground and noted wildlife sanctuary. Majestic peaks, ice-fields, beautiful lakes and famous resort, Jasper. Mineral hot springs, summer and winter sports. Accessible by rail, highway and air. Hotel and bungalow cabin accommodation. Equipped camp- grounds.
Mount Revelstoke...	Southeastern British Columbia, on west slope of Selkirks.	1914	100.0	Rolling mountain-top plateau. Colourful alpine meadows. Accessible by rail and highway. Summer accommodation in Park; all-year accommodation in town of Revelstoke. Championship ski runs and ski jump. Equipped camp-grounds.
St. Lawrence Islands.	In St. Lawrence River between Morrisburg and Kingston, Ont.	1914	189.4 (acres)	Mainland area and 13 islands among Thous- and Islands. Recreational and camping area. Accessible by highway: by boat from nearby mainland points.
Point Pelee.....	Southern Ontario, on Lake Erie.	1918	6.0	Recreational area. Remarkable beaches, southern flora. Resting place for mi- gratory birds. Accessible by highway. Hotel and bungalow cabin accommoda- tion. Equipped camp-grounds.
Kootenay.....	Southeastern British Columbia, on west slope of Rockies.	1920	543.0	Encloses Vermilion-Sinclair section of Banff-Windermere Highway. Broad valleys, deep canyons, mineral hot springs. Hotel and bungalow cabin accommodation. Equipped camp- grounds.
Prince Albert.....	Central Saskat- chewan, north of Prince Albert.	1927	1,496.0	Forested region dotted with lakes and interlaced with streams. Summer play- ground and recreational area. Accessible by highway. Hotel and bungalow cabin accommodation. Equipped camp- grounds.
Riding Mountain.....	Southwestern Mani- toba, west of Lake Winnipeg.	1929	1,148.0	Playground and wildlife sanctuary on summit of escarpment. Fine lakes. Accessible by highway. Hotel and bungalow cabin accommodation. Equip- ped camp-grounds.
Georgian Bay Islands	In Georgian Bay, north of Midland, Ont.	1929	5.4	Recreational and camping area. Unique pillars on Flowerpot Island. Accessible by boat from nearby mainland points. Equipped camp-grounds and annual youth camps on Beausoleil Island.

4.—Location, Year Established, Area and Characteristics of National Parks—concluded

Park	Location	Year Estab- lished	Area	Characteristics

Scenic and Recreational Parks—concl.				
Cape Breton High-lands.	Northern part of Cape Breton Island, N.S.	1936	390.0	Rugged Atlantic coast line with mountain background. Fine seascapes. Recreational opportunities. Hotel and bungalow cabin accommodation. Equipped camp-grounds.
Prince Edward Island.	North shore of Prince Edward Island.	1937	7.0	Strip 25 miles long on shores of the Gulf of St. Lawrence. Recreational area, fine bathing beaches. Accessible by highway. Hotel and bungalow cabin accommodation. Equipped camp-grounds.
Fundy.....	On Bay of Fundy between Moncton and Saint John in New Brunswick.	1948	80.0	Delightful recreational area. Forested region, wildlife sanctuary, rugged terrain. Bungalow cabin accommodation. Equipped camp-grounds.
Wild Animal Parks				
Elk Island.....	Central Alberta, near Edmonton.	1913	75.0	Fenced preserve containing large herd of buffalo; also deer, elk and moose. Popular recreational area. Accessible by highway. Bungalow cabin accommodation and equipped camp-grounds.
Wood Buffalo ¹	Partly in Alberta and partly in Northwest Territories, between Athabaska and Slave Rivers.	1922	17,300.0	Immense region of forests and open plains. Home of largest remaining herd of bison on the continent. Other wildlife abundant.
			acres	
Historic Parks				
Fort Anne.....	Nova Scotia, at Annapolis Royal.	1917	31.0	Site of early Acadian settlement. Museum and well-preserved earthworks.
Fort Beauséjour.....	New Brunswick, near Sackville.	1926	81.0	Site of French fort erected in middle of 18th century. Museum.
Fortress of Louisbourg.	Cape Breton Island, N.S., 25 miles from Sydney.	1941	340.0	Ruins of walled city erected by the French, 1720-40. Interesting excavations. Museum.
Port Royal.....	Lower Granville, N.S., 8 miles from Annapolis Royal.	1941	17.0	Restoration of "Habitation" or first fort built in 1605 by Champlain, DeMonts and Poutrincourt.
Fort Chambly.....	Chambly, Que.....	1941	2.5	French fort on Richelieu River, first built in 1665. Museum.
Fort Lennox.....	Ile-aux-Noix, Que., near St. Johns.	1941	210.0	Site of early French fort built in 1759.
Fort Wellington.....	Prescott, Ont.....	1941	8.5	Defence post built 1812-13. Museum.
Fort Malden.....	Amherstburg, Ont..	1941	5.0	Site of defence post built 1797-99. Museums.
Fort Prince of Wales.	Northern Manitoba, near Churchill.	1941	50.0	Ruins of fort built 1733-71 to secure control of Hudson Bay for England.
Lower Fort Garry..	Manitoba, 20 miles north of Winnipeg.	1950	13.0	Stone-walled fort built by the Hudson's Bay Company between 1831 and 1839.
Fort Battleford.....	Saskatchewan, 4 miles south of North Battleford.	1951	36.7	North West Mounted Police post built in 1876.

¹ Administered by the Northern Administration and Lands Branch, Department of Resources and Development.

Provincial Parks.—In addition to the National Parks already described, most of the provinces have established Provincial Parks. These Parks, as in the case of the National Parks, are areas of great scenic or other interest maintained for the benefit of present and future generations. The Provincial Parks are administered by the Provincial Governments concerned and in most cases they have not yet reached the degree of development which marks the National Parks. In Prince Edward Island, Nova Scotia, New Brunswick and Manitoba there are no Provincial Parks.

5.—Location, Year Established, Area and Characteristics of Provincial Parks

Province and Park	Location	Year Estab- lished	Area	Characteristics
			acres	
Newfoundland— Serpentine.....	South of Humber Arm, west coast.	1939	26,880	Undeveloped.
Quebec— Laurentides.....	25 miles north of Quebec city, on both sides of Quebec-Chicoutimi high- way.	1895	2,373,120	Altitude 3,000 ft., numerous lakes, tumultuous rivers. Speckled trout, moose, deer, black bears, wolves, etc. No hunting. Three hotels and 50 fishing camps.
Trembling Mountain.	80 miles north of Montreal. Mont Tremblant Village close to the southern section of Park.	1895	782,720	Famous resort area, summer and winter. Ski school and lifts, 40 miles of ski trails, 9 ski slopes. Lac Trem- blant 750 ft. above sea-level. High- est peak Mont Tremblant, 3,100 ft.
Gaspesian.....	Gaspé Peninsula.....	1937	328,960	Established to preserve caribou and wildlife on south side of St. Lawrence. Accessible from Ste. Anne des Monts, Gaspé. Speckled trout, 5 fishing camps. One hotel at Ste. Anne des Monts. Includes the highest peaks of the Shickshock Mountains. High- est peak Mount Jacques-Cartier, 4,200 ft.
Mount Orford.....	On Orford Mountain, 15 miles west of Sherbrooke.	1938	9,970	Altitude 2,860 ft. Skiing and golfing.
La Vérendrye.....	In western part of Province 140 miles northwest of Montreal on both sides of route Montreal - Abi- tibi.	1939	2,043,520	Altitude 1,200 ft. Numerous lakes and rivers. Trout, pike, pickerel and bass. Tourist accommodation and stopping place. Twelve fishing camps maintained by Dept. of Fish and Game.
Chibougamau Fish and Game Re- serve.	30 miles west of Lake St. John. Strip 80 miles long on both sides of Lake Chibougamau highway.	1946	2,176,000	Altitude 1,300 ft. Numerous lakes and rivers. Trout, pike and pickerel. Five fishing camps and one camping ground maintained by Dept. of Fish and Game.
Shick Shocks Fish and Game Re- serve.	Adjacent to and complet- ing Gaspesian Park.	1949	200,960	See "Gaspesian" above.
Kipawa Lake Fish and Game Re- serve.	Approximately 8 miles northeast of Timiska- ming.	1950	640,000	Altitude 1,000 ft. Numerous lakes and rivers. Trout, pike and pickerel.
Ontario— Algonquin.....	In southeastern Ontario in the District of Nipissing and the County of Hali- burton, 141 miles north of Toronto, 105 miles west of Ottawa.	1893	1,754,240	Wilderness area, wildlife preserve. Hotels, summer cottage sites, camp- ing facilities, canoe trips, fishing, bathing.

Rondeau.....	In southwestern Ontario in the County of Kent, 20 miles southeast of Chatham, 70 miles east of Windsor.	1894	5,120	Partly cultivated, fine timber stands. Enclosed and wild animals. Fishing, duck - hunting, camping facilities, summer cottage sites, restaurant, store, dance pavilion, other recreational facilities.
Quetico.....	In northwestern Ontario in the Rainy River district. Southern boundary adjoins the International Boundary midway between Port Arthur and Fort Frances.	1913	1,190,400	Wilderness area, wildlife preserve. Camping facilities, canoe trips, fishing.
Ipperwash Beach.	In southwestern Ontario in the County of Lambton, on Lake Huron, 100 miles north of Windsor, 50 miles north of Chatham.	1937	109	Sand beach, woodland area. Fishing, camping facilities, bathing.
Lake Superior....	In northeastern Ontario in the District of Algoma, on Lake Superior, about 70 miles north of Sault Ste. Marie.	1944	345,600	Wilderness area, wildlife preserve. Fishing.
Sibley.....	In northwestern Ontario in the Thunder Bay district. On north shore of Lake Superior, 40 miles northeast of Port Arthur and Fort William.	1944	40,320	Wilderness area, wildlife preserve.
Saskatchewan—				
Cypress Hills....	South of Maple Creek near International Boundary.	1932	10,880	Forest area. Bungalow, lodge and cabin accommodation, auto camp.
Duck Mountain...	15 miles northeast of Kam-sack.	1932	51,840	Forest and lake area. Beaches. Fish and wild life.
Good Spirit Lake.	20 miles west of Canora...	1932	3,827	Camp and picnic grounds. Fishing, swimming.
Greenwater Lake.	North of Kelvington.....	1932	22,240	Forest and lake area. Swimming, fishing.
Lake Katepwa....	In Qu'Appelle Valley, 14 miles north of Trans-Canada Highway from Indian Head.	1932	17	Lake area, camping, fishing, swimming, playground activities.
Little Manito....	On Manitou Lake.....	1932	238	Medicinal waters. Chateau, cabin and tourist accommodation.
Moose Mountain...	15 miles north of Carlyle.	1932	98,560	Lake area. Poplar and white birch stands. Fishing.
Nipawin.....	35 miles northwest of Nipawin.	1934	161,280	Lodgepole pine stands. Camping, trout fishing.
Lac La Ronge....	190 miles north of Prince Albert.	1939	729,600	Lake area. Spruce and poplar stands. Tourist accommodation, trout fishing.
Alberta—¹				
Ghost River.....	On Ghost and Bow Rivers west of Calgary.	1930	536	Artificial lake. Cottages and picnic ground.
Saskatoon Mountain Reserve.	In Grande Prairie district.	1930	3,000	Mountain lookout.

¹ Excludes 16 small parks which are mainly of local interest (see pp. 26-27 of the 1950 Year Book)

Writing-on-Stone Reserve.	On Milk River east and north of Coutts.	1930	796	Natural obelisks with undeciphered hieroglyphics. Summer village.
Saskatoon Island..	West of Grande Prairie....	1932	250	Picnic ground.
Bad Lands Reserve.	North of Drumheller.....	1934	1,800	Fossilized remains of prehistoric animals.
Elkwater Lake....	On south shore of lake at foot of Cypress Hills.	1947	378	Cottages, recreation and camp grounds. Limited accommodation for transients.
Crimson Lake....	9 miles northwest of Rocky Mountain House.	1948	900	Cottages. Swimming, fishing, picnic and sports ground.
Red Lodge.....	9 miles west of Bowden on Little Red Deer River.	1948	45	Swimming. Picnic and sports ground.
Kinbrook Island..	Island in Lake Newell, 9 miles south of Brooks.	1949	90	Island connected by causeway to lake shore. Boating and swimming; recreation and picnic grounds.
British Columbia — ¹				
Strathcona.....	Campbell River, Vancouver Island.	1911	529,920	Oldest B.C. Provincial Park, situated in the rugged centre of Vancouver Island. Contains many glaciers, alpine meadows and lakes. Della Falls, one of the world's highest falls. Undeveloped and mostly inaccessible.
Mt. Robson.....	Mt. Robson, adjacent to Jasper Park.	1913	513,920	Rocky Mountain park featuring Mt. Robson, highest peak in the Canadian Rockies, Berg Lake and impressive glaciers. Access to Berg Lake Camp by horse trail.
John Dean.....	Sidney, near Victoria, Vancouver Island.	1921	98	Mountain viewpoint overlooking the Saanich Peninsula and Gulf Islands. Features primeval forests and wild flowers. Picnic grounds and hiking trails. Accessible by road.
Kokanee Glacier..	Near Nelson.....	1922	64,000	High mountain park featuring Kokanee Glacier and several scenic lakes. Fishing, mountaineering and skiing. Poor road and trail access.
Mt. Assiniboine...	South of Banff.....	1922	12,800	Outstanding area of Rocky Mountain scenery, features Mt. Assiniboine and small lakes. Hiking, riding, fishing, skiing. Access by horse trail.
Nakusp Hot Spring.	Nakusp, Arrow Lake, southeast B.C.	1925	127	Hot springs. Access by eight miles of trail.
Salt Lake.....	Prince Rupert.....	1925	87	Community swimming and picnic area. Access by ferry from Prince Rupert.
Garibaldi.....	Haney - Squamish, lower mainland, north of Vancouver.	1927	612,615	Outstanding scenic park with mountain lakes, peaks and glaciers, flower meadows and interesting geological features. Potential winter sports area. Access by trail from several points on the Pacific Great Eastern Railway.

¹ Excludes 31 parks which are mainly of local interest (see pp. 27-30 of the 1950 Year Book).

Mt. Seymour.....	North Vancouver main- land.	1936	9,156	Mountain, winter sport park with sum- mer hiking, swimming and berry picking. Highway under construc- tion.
Crescent Beach...	Crescent Beach, lower mainland near Interna- tional Boundary.	1938	237	Ocean beach. Accessible by road.
Tweedsmuir.....	Bella Coola, Burns Lake..	1938	3,456,000	One of the larger wilderness areas in North America. Scenic boat tours and trail rides. Fishing and hunting.
Peace Arch.....	White Rock, B.C., and Blaine, Washington, In- ternational Boundary.	1939	16	Landsaped international park featur- ing Peace Arch. Picnic grounds. King George VI Highway.
Wells Gray.....	North of Kamloops.....	1939	1,165,005	Undeveloped lake and mountain park. Fishing and hunting. Accessible by poor road and trail.
Chasm.....	Clinton, central B.C.....	1940	315	Outstanding geological feature — a great chasm in the Interior Plateau adjacent to the Caribou Highway.
Elk Falls.....	Campbell River, east coast, Vancouver Island.	1940	2,558	Series of cascades and falls on Camp- bell River. Stand of giant firs.
Englishman River Falls.	Parksville.....	1940	240	Forest area, picturesque river contain- ing falls and canyons. Picnicking, swimming, camping and hiking. Accessible by highway.
Little Qualicum Falls.	Qualicum Beach, adjacent to Parksville - Alberni Highway.	1940	207	Forest area, picturesque river contain- ing falls and canyons. Picnicking, swimming, camping and hiking. Accessible by highway.
Premier Lake.....	Cranbrook, Canal Flats, southeast B.C.	1940	165	Mostly local use. Fishing, picnicking, swimming. Poor road access.
Silver Star.....	Vernon, Okanagan, south central B.C.	1940	21,888	Interior mountain park, alpine scenery, berry picking, skiing. Accessible by poor road.
Stamp Falls.....	Alberni, Vancouver Island.	1940	424	Popular forest park with river falls, fish ladder and swimming pool. Picnicking, camping. Road access.
Hamber.....	Big Bend Highway. Park adjoins Jasper and Banff.	1941	2,431,960	Undeveloped forest and mountain area bordering easterly portion of Big Bend Highway.
Manning.....	Hope-Princeton Highway, south central B.C. near International Boundary.	1941	179,313	Mountain park featuring alpine flower meadows and scenic fishing lakes. Wildlife sanctuary. Accessible by highway.
Darke Lake.....	Summerland, south Okan- agan.	1943	5,472	Scenic group of interior mountain lakes. Fishing, hunting and boating.
McMillan.....	Cameron Lake, Vancouver Island.	1944	337	World-famous stand of virgin west- coast forest. Accessible by Alberni- Parksville Highway.
Memory Island...	Shawnigan Lake, south Vancouver Island.	1945	2	Small undeveloped island in recrea- tional area. Swimming, fishing, adjacent to highway.
Petroglyph.....	Nanaimo, east coast, Van- couver Island.	1948	4	Site of ancient rock carvings of un- known origin. Accessible by road.

Ivy Green.....	Ladysmith, Vancouver Island.	1949	51	Community park and picnic ground.
Cameron Lake....	Cameron Lake.....	1950	733	Attractive lakeside area in an unspoiled rugged mountain valley adjacent to Parksville-Alberni Highway.
Miracle Beach....	Oyster River, north Van- couver Island.	1950	142	Ocean beach with outstanding vista over the Gulf Islands.

Subsection 4.—The National Capital Plan*

The Master Plan to guide the long-range development of Ottawa and the National Capital District, and to create a Capital in keeping with Canada's achievements and status as a nation, was completed at the end of 1948. The preliminary report of the National Capital Planning Committee and the Federal District Commission was tabled in the House of Commons on Apr. 30, 1949, and the Final Report of Jacques Greber and his Canadian associates on the Plan was forwarded to the Government by the National Capital Planning Committee and the Federal District Commission† and tabled in the House of Commons by the Prime Minister on May 22, 1951. For further details see Year Book 1950, pp. 18-20.

Considerable progress is reported on the implementation of the Master Plan, both in the detailed planning of new developments and in actual construction work. A high degree of co-operation has been achieved between the municipalities in the District and the Federal planning authorities. Particularly important in this regard was the acceptance by the Ottawa Planning Area Board (the Ontario municipal-provincial planning authority) of the proposed urban and inter-urban road system, and the initiation by Ottawa's Municipal Planning Department of a comprehensive zoning plan conforming to the recommendations of the Master Plan.

Discussions took place in 1951 with the City of Ottawa regarding the Federal District Commission's share of the costs of extending municipal water and sewage services in conformity with the Master Plan; the projects concerned were the Carlington and Alta Vista reservoirs and the west and south Nepean and south Rideau interceptor sewers which, in part, service new Federal Government building areas.

Since 1946, the Federal District Commission must approve the location and external architecture of all new Federal Government buildings, or alterations to existing buildings. This control is exercised, initially, by the Architectural Sub-Committee of the National Capital Planning Committee. During 1951 this Sub-Committee co-ordinated and assisted in the preparation of plans for the large-scale development of the Ottawa Airport jointly by the Royal Canadian Air Force, the Department of Transport and the National Aeronautical Establishment, and approved other

* Revised by the Federal District Commission, Ottawa.

† See p. 83 for history, organization and activities of the Commission.

development and construction plans in the Capital and District for the Defence Research Board, the National Research Council, the Experimental Farms Branch of the Department of Agriculture and the Department of Public Works.

The Commission, on the recommendation of the Sub-Committee, has approved submissions by various departments of the Federal Government for eight major site plans and 60 buildings. Construction is well advanced on a number of these projects, the most important including buildings for the Department of Veterans Affairs on Wellington Street, the Dominion Bureau of Statistics and Department of Public Works at Tunney's Pasture in the west end of the city, Central Mortgage and Housing Corporation on the Montreal Road, Eastview, extensions to the Bureau of Mines establishment on Booth Street and the Government Printing Bureau at Hull, Que.

The MacKenzie King Bridge in Confederation Park, built by the Federal District Commission in co-operation with the City of Ottawa, was made usable, temporarily, on Dec. 8, 1951, while approaches and final surfacing, etc., will be completed as soon as possible. This provides another greatly needed east-west route through the centre of the Capital, enabling heavy commercial traffic to by-pass the National War Memorial at Confederation Square and Wellington Street, the main artery for Government buildings, and also relieving serious traffic congestion on other bridges over the Rideau Canal. The eastern section of the span of the bridge over the railway yards, now supported by steel pillars, cannot be finished in conformity with the remainder of the bridge until the Union Station and rail yards are re-located in south Ottawa some years hence.

The Highways and Traffic Sub-Committee of the National Capital Planning Committee examined, and the Commission subsequently approved, road re-locations necessitated by the expansion of the Ottawa Airport and extensions to the Commission's driveway system, and made recommendations regarding a new riverside driveway from the Quebec end of the Champlain Bridges to Aylmer. The Gatineau Power Company *et al* made a generous gift to the Commission of the abandoned Hull Electric Railway right-of-way from Hull to Aylmer.

Installation of new railway facilities proceeded in accordance with the long-range plans to move the railway lines from central Ottawa and Hull to the outskirts, and subsequently to use the abandoned rights-of-way as the basis of a new arterial road system for the Capital. Land was acquired along the new rail belt for the re-location of industries that require rail services. Grading was completed for the rail belt and yards for the use of the Canadian National Railways along the Walkely Road at the south edge of Ottawa. Two highway overpasses on the Metcalfe and Russell Roads were completed, except for hard-surfacing of the roadways.

Construction was begun of a junction of the two C.N.R. lines near South March, a few miles west of the Capital, to enable traffic to be routed to the new belt line and yards. The installations may be ready for use in about two years, when the C.N.R. will transfer its operations from the crosstown tracks and yards, which bisect the Capital along Catherine Street. The abandoned crosstown right-of-way will be used for the construction of a new east-west traffic artery from Hurdman's Bridge to the west end of the Capital and a junction with Highway 17 beyond Britannia. The crosstown artery will be linked with Highway 17 on the east by an extension northeast of Hurdman's Bridge to the vicinity of Green's Creek. This will result in an entirely new main eastern entrance to the Capital for the Montreal Road, by-passing Eastview and built-up areas. It will also route through-traffic on Highway 17 away from the congested city centre.

Gatineau Park.—Gatineau Park is situated in the Laurentian Mountains of Quebec, north of the city of Hull and about eight miles from Ottawa. It was established by the Federal District Commission in 1938 for the enjoyment of the public in perpetuity. Known as the summer and winter playground of the National Capital, it is well provided with hiking trails, picnic and camping spots. Swimming, boating and fishing are enjoyed in its many lakes, and in the winter it is the skiing centre of the Capital District. The large country estate bequeathed to the nation by The Rt. Hon. W. L. MacKenzie King, and placed in the care of the Commission, is located on Kingsmere Lake in the southern section of the Park. The area of the Park was increased from about 28,000 to 32,000 acres in 1951 with the acquisition of the Edwards-Herridge property surrounding Mousseau (Harrington) Lake. Plans call for its ultimate development to about 80,000 acres. The Park is administered by a Superintendent and a small force of rangers who also act as game wardens, police constables and fire wardens. Facilities for its use by the public are added each year as funds permit.

Section 3.—Wildlife Resources and Conservation

The Canadian Wildlife Service.*—The Canadian Wildlife Service of the National Parks Branch, Department of Resources and Development, is responsible for attending to wildlife matters coming within the jurisdiction of the Federal Government, except those within the purview of the National Museum and certain activities closely related to Indian Affairs.

Its functions include acting in an advisory capacity with regard to conservation and management of wildlife in the Northwest Territories; advising and co-operating with the National Parks and Historic Sites Division regarding fish and wildlife problems in the National Parks; and administration of the Migratory Birds Convention Act, in conjunction with the Royal Canadian Mounted Police and in co-operation with the provincial game authorities. The Canadian Wildlife Service also handles national and international problems relating to Canada's wildlife resources, and co-operates with governmental and other agencies having similar interests and problems in Canada and elsewhere.

The Service issues permits for bird-banding in Canada, and is the Canadian clearing-house for bird-banding information. It issues permits to qualified persons to take migratory birds for scientific purposes; to take and possess migratory birds for propagating purposes; to collect eiderdown; to use firearms or other equipment for the control of migratory birds causing damage to agricultural, fishing or other interests; and to engage in the business of taxidermy.

The Canadian Wildlife Service plans and carries out scientific investigations concerning numbers, food, shelter, migration, reproduction, diseases, parasites, predators, competitors and uses of wild creatures in Canada. In certain of such investigations, e.g., the mid-winter waterfowl inventory, it works in close co-operation with United States authorities conducting parallel studies.

The Service is responsible for establishment and administration of bird sanctuaries under the Migratory Birds Convention Act. On Sept. 30, 1951, there were 80 bird sanctuaries, with a total area of 1,800 sq. miles.

* Revised by the Canadian Wildlife Service, Department of Resources and Development.

The Limnology Section of the Service concerns itself with the maintenance and improvement of sport fishing, the control of aquatic and semi-aquatic insects, the control of algæ, and other biological problems that arise in regard to water areas in the National Parks. It also acts in an advisory capacity to the Northern Administration and Lands Branch in connection with aquatic biological matters.

A series of special articles with relation to the wildlife resources of Canada are being carried in the Year Book. The 1951 edition carried an article on "Migratory Bird Protection in Canada". Game and fish abound in the National and Provincial Parks and although hunting is forbidden in these preserves the age-old art of angling can be enjoyed under the most favourable circumstances. The following article deals with this subject from the sportsman's viewpoint.

GAME FISH IN CANADA'S NATIONAL PARKS*

The universal appeal of angling, from the boy with the sapling, string and bent pin to the dry-fly "purist" with his imported hand-made rod, tapered line and delicate flies, creates a kinship which goes far deeper than a mere love of fish or even of catching them. Angling is much more than a battle of wits and equipment against the cunning of a fish, for it offers release from the cares of the work-a-day world and a chance to see and enjoy the unspoiled beauties of nature, together with the possible added thrill of capturing a colourful aquatic creature satisfying to the eye and often to the inner man as well.

Many anglers are experts in the mysteries of taking game fish from their native haunts. Experts also are the men whose work it is to replace the game fish and then to maintain their supply against an ever-increasing number of anglers. A few of the problems encountered in this work and the means by which they are overcome are discussed here, so that the angler may know something of the activity which precedes his angling holiday.

Angling in the National Parks is a major attraction for visitors and the sport has been perpetuated through a wise policy of research and management. The maintenance and improvement of angling in waters within National Parks, whether in the mountain parks of British Columbia and Alberta, on the Prairies, or in the Eastern Provinces, involves the solution of many problems. Some of these are basic to successful fish management in any area, others are peculiar to individual locations.

Problems dealing with the basic requirements for fish propagation involve such items as food, shelter, areas suitable for spawning, water temperatures and related factors. Special local problems may be dependent on such factors as rate of water flow, silt, dissolved gases in the water, presence of large numbers of animals or birds which feed on fish, high angling pressure, and competition of fish of several species for a common food supply.

The solution of such difficulties affecting the National Park waters calls for close teamwork by two Federal Government agencies—the Canadian Wildlife Service which acts in an advisory capacity regarding all fish and wildlife matters in the Parks and conducts scientific investigations as and where required, and the National Parks Service whose officers, guided by the results of the Wildlife Service investigations, operate the hatcheries and egg-collecting stations, distribute the fish, collect data from anglers and perform other related duties.

* Prepared under the direction of Major-General H. A. Young, Deputy Minister, Department of Resources and Development, by Victor E. F. Solman, Ph.D., Chief Biologist, Canadian Wildlife Service.

The Mountain National Parks.—From the Selkirk Mountains in British Columbia to the Maritimes in Eastern Canada, the National Parks present a wide variety of game fish that appeal to the discriminating and to the casual angler. In the western mountains, Jasper and Banff National Parks in Alberta possess no fewer than six species of trout—the rainbow, the cutthroat, the eastern brook or speckled trout, highly prized by most anglers, the lake trout, Dolly Varden and the brown trout varieties which add interest to the group. Waterton Lakes National Park, in the extreme southwest corner of Alberta, offers all of these species except brown trout. Pike also are taken in Jasper and Waterton Lakes Parks.

The cutthroat trout is common to the four National Parks in British Columbia—Yoho, Kootenay, Glacier and Mount Revelstoke. In addition the Dolly Varden is native to the waters of the first three and all except Glacier Park have rainbow trout. Lake trout await the lure in Yoho Park.

All seven western mountain National Parks mentioned have waters inhabited by the Rocky Mountain whitefish. This species, although not a true game fish, provides good sport for anglers on fly or bait at certain seasons and are a welcome addition to the pan.

The Prairie National Parks.—Descending from the mountains to the prairies, the angler finds the lakes of Prince Albert National Park in Saskatchewan and Riding Mountain National Park in Manitoba are the home of large pike, specimens of over 15 lb. in weight having been caught there on occasion. Prince Albert National Park also attracts the fisherman with lake trout and pickerel, trout in the larger lakes often attaining a weight of 35 lb.

Adult and yearling lake trout have been introduced into Clear Lake in Riding Mountain Park and these specimens are showing satisfactory growth. Suitable food organisms and spawning areas are present in the Lake, and a natural increase of the lake trout there will be a source of continuing enjoyment to the angler.

The Eastern National Parks.—Famous among the game fishes of Eastern Canada are the smallmouth and largemouth black bass and the giant maskinonge, all rivalling the mountain trout in popularity among sportsmen. These species provide good fishing in provincial waters adjacent to the Georgian Bay Islands and St. Lawrence Islands National Park in Ontario. The visitor to Point Pelee National Park, also in Ontario, may supply his creel with pike from the inland ponds or with pickerel and smallmouth black bass from the adjacent waters of Lake Erie.

Fundy National Park in New Brunswick, with its several lakes and streams, supports large numbers of eastern brook trout and Atlantic salmon angling facilities are being developed in the Bay. Several of the small lakes and ponds in Prince Edward Island National Park afford opportunities for angling of brook trout and white perch. Deep-sea fishing is also available in coastal waters adjacent to this Park. The Cape Breton Highlands National Park in Nova Scotia provides good angling for Atlantic salmon and eastern brook trout. Visitors to this Park also enjoy opportunities for catching swordfish in offshore waters.

Following is an annotated list of game fish in Canada's National Parks waters.*

American Grayling (*Thymallus signifer*).—Distinguishable by its long, high dorsal (back) fin, which is brilliantly coloured. Back is purple to brownish in colour and the underside white or greyish, with whitish-blue spots on body. Occurrence of this fish is rare in the Parks.

* Extracts from the Angler's Guides for the Mountain, Prairie, and Eastern National Parks.

Atlantic Salmon (*Salmo salar*).—The king of Canada's game fish. Back light brown and sides silvery, both sparsely marked with black spots, usually x-shaped. The young, called "parr", show vermilion and dark vertical bars. When they descend to the sea, the "smolts" are a bright silvery colour. The adults return to fresh water to spawn.

Brown Trout (*Salmo trutta*).—Back and sides decidedly brown; the back is covered with large black spots and the sides with red or dark spots surrounded by light rings.

Cutthroat Trout (*Salmo clarkii*).—Several sub-species, varying considerably in colour, occur in the mountain National Parks. Back generally dark, greenish to brownish green, profusely covered with black spots, which are usually more numerous toward the tail. Lower half of body yellowish-white to yellowish-brown, with fewer black spots than upper half. The gill cover is usually rosy in colour and this colouring may extend along the sides as in the Rainbow Trout. A red mark on the membrane of the lower jaw gives the fish its name.

Dolly Varden or Bull Trout (*Salvelinus malma*).—Colour is brownish to olive green, with large pink and sometimes orange spots on back and sides. Lower fins dusky, with pale margins, followed by darker hue; well forked tail.

Eastern Brook Trout or Speckled Trout (*Salvelinus fontinalis*).—Has a dark back with olive green vermiculations or worm-like markings; blue-ringed, red spots on the sides; back fin mottled black and olive green; pectoral and ventral fins pink with white edge. The colouring of this fish varies greatly with the environment and the season. When, in the eastern National Parks, this species returns to fresh water from the sea, it is silvery in colour; this silvery colour disappears after a time in fresh water.

Lake or Grey Trout (*Cristivomer namaycush*).—General colour grey to greyish green with paler spots. Dorsal (back) and caudal (tail) fins marked with darker hue. Tail fin forked. Frequently this fish attains a weight of 20 lb. or more.

Pike (*Esox lucius*) (sometimes called Northern Pike or Jackfish).—Dark olive body, grading to silver or white on lower side, back and sides mottled with white. Long bill-like snout, numerous needle-like teeth. Scales smooth, fins often pink.

Rainbow or Steelhead Trout (*Salmo gairdnerii*).—Dark greenish back; irregularly covered with black spots or flecks, most of which are above the lateral line. There is a definite rosy band along each side from head to tail. Below the rosy band the colour may vary from silver to cream.

Hybrids—Rainbow-Cutthroat Cross.—These hybrids are rapidly increasing in Banff National Park and may be found in Waterton Lakes National Park and other locations. This species usually favours the Rainbow in colour and markings but shows the red or orange marks under the lower jaw characteristic of the Cutthroat.

Rocky Mountain Whitefish (*Prosopium williamsoni*).—A small fish, faintly bluish in colour, with silvery sides. All fins tipped with black. Averages about one foot in length and has a small mouth. This species is often confused with the grayling.

Yellow Perch (*Perca flavescens*).—Back greenish, grading to golden yellow on sides; broad vertical dark green bars crossing each side; belly whitish. Pointed head; body deep with flattened sides. Spine at extreme end of opercle. Numerous small needle-like teeth; scales rough. Two dorsal (back) fins, the forward one with stiff spines.

Yellow Pikeperch or Walleye (*Stizostedion vitreum*) (sometimes called Pickerel).—Ranges from yellow to dark olive brown mottled with brassy flecks. Pointed head, long slender round body, numerous needle-like teeth, scales rough. Two dorsal (back) fins, the forward one with stiff spines.

White Perch or Silver Bass (*Morone americana*).—Back green or olive colour; sides paler green to silvery, usually with pale longitudinal streaks. Two dorsal fins, the forward one with stiff spines. Ventral fins also with spines. Scales large and rough.

PART III.—CLIMATE AND TIME ZONES

Section 1.—Climate

A comprehensive discussion of the climatic regions of Canada is available in the Year Book 1948-49, pp. 41-62, while detailed tabulations of climatic factors covering thirty-six meteorological stations located mostly at well-known or populous centres are given in the Year Book 1950, pp. 35-70. Other articles appearing in previous editions are listed under "Climate and Meteorology" in Chapter XXVIII of this volume.

Table 1 gives long-term temperature and precipitation data for 35 representative Canadian stations; Tables 2 and 3 provide monthly temperature and precipitation data during 1950 for these same stations.

¹ Day-degrees represent the difference in temperature between the mean temperature of the air and the temperature of 65°F. multiplied by the number of days during which the outside temperature was lower than that figure, computed for the period Sept. 1 to May 31. Fuel consumption for heating purposes will be proportional to these totals.

Section 2.—Standard Time and Time Zones

In former times, when transportation was slow, time was based on 'sun time'. The difference in sun time as between communities was, of course, determined by the difference in their longitude. A locality precisely one degree of longitude west of another in the same latitude naturally had sunrise and sunset four minutes later than did the community one degree farther east.

The advent of rapid transportation made these 'local times' extremely inconvenient for travellers. It was almost impossible to work out railway time-tables on the basis of the local times of each community. Consequently, in Great Britain, where the differences of longitude are comparatively small, the problem was solved in 1880 by placing the whole country on the time of Greenwich Observatory, and the time in Ireland was standardized at twenty-five minutes behind Greenwich time, being the time of Dublin.

From 1878, Sir Sanford Fleming advocated standard time and, at a world conference held at Washington, D.C., in 1884, 'standard time' was adopted. Standard time sets the number of times in the world at 24, each time zone to extend over one twenty-fourth of the surface of the earth and to include all the territory between two meridians, 15° longitude apart. Standard time would be Greenwich time, all other time zones being a definite number of hours either in advance of or behind Greenwich. As the North American Continent extends over such an enormous distance from east to west, it was necessary to establish a number of time zones. Atlantic, Eastern, Central, Mountain, Pacific, Yukon and Alaska time zones have times, respectively, four, five, six, seven, eight, nine and ten hours behind Greenwich. The differences are usually expressed in intervals of so many hours difference from Greenwich; however, some localities of smaller area have times which are not an exact hours difference from Greenwich.

Canada has seven time zones, the most easterly being Newfoundland standard time, three hours and thirty minutes behind Greenwich mean time. Atlantic standard time, which is local time at the 60th meridian running near Sydney, N.S., and is four hours behind Greenwich, is used in the Maritime Provinces and those parts of Quebec and the Northwest Territories east of the 68th meridian of west longitude. Eastern standard time, which is the local time at the 75th meridian running near Cornwall, Ont., and is thus five hours behind Greenwich, is used in Quebec west of the 68th meridian, in Ontario east of the 90th meridian and in the Northwest Territories between the 68th and 85th meridians. Central standard time, which is the local time at the 90th meridian, is six hours behind Greenwich and is used in Ontario west of the 90th meridian, in Manitoba and the Northwest Territories between the 85th and the 102nd meridians and in the southeasterly part of Saskatchewan. Mountain time, which is the local time at the 105th meridian running near Regina, is seven hours behind Greenwich and is used throughout Saskatchewan except in the southeasterly part, throughout Alberta and in that part of the Northwest Territories between the 102nd and 120th meridians. Pacific standard time, which is local time of the 120th meridian running near Kamloops, B.C., is eight hours behind Greenwich and is used throughout British Columbia and in that part of the Northwest Territories lying west of the 120th meridian. Yukon standard time, which is the local time at the 135th meridian, running near Whitehorse, Yukon, is nine hours behind Greenwich and is used throughout Yukon.

Territory. Thus, throughout Canada there are seven different standard times roughly corresponding with the 88 degrees of longitude between St. John's, Nfld., and the Alaskan boundary.

Some municipalities adopt the time used by the local railways, which in some cases differs from the standard, and there are also villages that adopt such time as seems best to suit their convenience, but, in general, the legal boundaries of the different time zones are actually in use.

Daylight Saving Time.—For some years before World War I there was active propaganda, particularly in the cities, for the use of an earlier time, usually referred to as 'daylight saving time', one hour ahead of standard time, during the summer months. It was considered, both from the economic and from the health point of view, that people in industrial towns and cities would gain by having longer periods of sunlight at their disposal for recreation. Canada adopted daylight saving time in 1918, but the Canadian Act lapsed at the end of that year. Since that date, however, various towns and cities have adopted daylight saving by-laws for varying periods in the summer months.

Legal Authority for the Time Zones.—Most of the regulations made in Canada concerning standard time have been passed by the provincial legislatures and the Northwest Territories Council. The exceptions include: the Daylight Saving Act of 1918; an Order in Council (P.C. 4994) issued in 1940 requiring the continuation, for an additional period, of daylight saving time in a number of places in Ontario and Quebec where it had already been in force for the summer; and an Order in Council in 1942 (P.C. 547) making daylight saving time nation-wide, and later revoked by Order in Council (P.C. 6102), ending the observance on Sept. 30, 1945. Legislation, besides determining the boundaries of zones, regulates

such matters as the times of coming into effect or expiration of Acts, ordinances, contracts and agreements, times of opening and closing registration offices, law courts, post offices and other public offices, times of open or close seasons for game, and times of opening and closing business houses and places of amusement.

PART IV.—ASTROPHYSICS

The science of astrophysics is carried on by three Canadian institutions: the Dominion Observatory, Ottawa, Ont., the Dominion Astrophysical Observatory, Victoria, B.C. (operated by the Department of Mines and Technical Surveys), and the David Dunlap Observatory, associated with the University of Toronto. Of the two Government institutions, the Dominion Observatory at Ottawa has specialized mainly in the astronomy of position in solar physics and in various branches of geophysical work, while the major effort in astrophysics has been concentrated at the Dominion Astrophysical Observatory at Victoria, B.C. The David Dunlap Observatory is a newer institution founded in 1935 with very fine astrophysical equipment of a kind similar to that in use at Victoria. It not only performs the function of a privately financed and administrated research institution but is also the nucleus of a university department of astronomy. A special article dealing specifically with the work of the Dominion Astrophysical Observatory at Victoria, B.C., appears in the Year Book, 1948-49, pp. 63-71.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

PART I.—THE CANADIAN CONSTITUTION

The Government of Canada is provided for by the British North America Act (30-31 Vict., c. 3) of 1867 and subsequent amendments. These statutes of the United Kingdom Parliament, usually referred to as 'The British North America Acts, 1867-1951', form the written basis of the constitution by which Canada is governed.

The British North America Acts, 1867-1951, do not contain the complete description of Canada's constitution. External restraints upon Canadian autonomy have been removed by the development of conventions and usages which, although not all expressed in laws, are equally binding. In a similar fashion in the domestic field, the machinery of Canadian government, both federal and provincial, operates partly in accordance with the written constitution, as far as it goes, and partly in accordance with conventions and usages which are frequently called the 'unwritten constitution'. One such convention is that only a committee of the Queen's Privy Council for Canada meets to transact business and never the whole membership. Two more sources of the constitution of Canada are the laws of the Federal Parliament itself* and the decisions of the Courts on matters of constitutional law.† Finally, the executive power in respect of Canada is governed only in general terms by statutes. The commissions and instructions of successive Governors General contain a wealth of constitutional source material.‡

* See the collection of constitutional documents entitled *British North America Act and Amendments, 1867-1948* (King's Printer, 1948, Ottawa) for some of these laws. A recent and important addition is 13 Geo. VI, c. 37, which gives the Supreme Court of Canada the exclusive ultimate appellate civil and criminal jurisdiction in Canada and abolishes appeals to the Privy Council in London, England.

† See the collection of cases before the Juridical Committee of the Privy Council in three volumes: Cameron, *The Canadian Constitution* (Butterworth, 1915, Winnipeg); Cameron, *The Canadian Constitution, Vol. II* (Carswell, 1930, Toronto); and Plaxton, *Canadian Constitutional Decisions* (King's Printer, 1939, Ottawa).

‡ See pamphlet entitled *Letters Patent constituting the Office of Governor General in Canada, effective October 1, 1947, with Appendices* (King's Printer, 1947, Ottawa).

The two basic characteristics of the Canadian constitution are that it is federal and that, apart from the federal aspect, it is modelled closely on the British Parliamentary system.

Federation occurred in 1867 with the union of three colonies, Nova Scotia, New Brunswick, and Canada, which was divided into two provinces, Ontario and Quebec. The colony of British Columbia joined in 1871 and Prince Edward Island in 1873. Three other provinces were created out of portions of Rupert's Land and the North-Western Territory held by the Hudson's Bay Company and transferred to Canada, June 23, 1870: Manitoba in 1870, and Saskatchewan and Alberta in 1905. Newfoundland, by a majority vote in a national referendum taken on July 22, 1948, decided to enter Confederation and became a province of Canada on Mar. 31, 1949. (*See also p. 64.*)

The British North America Act, 1867, and amendments, divides the field of legislative and executive power between national and provincial authorities. It provides also the legal framework for national and provincial political institutions, but leaves the provinces full discretion to amend their own constitutions,* except with respect to the office of Lieutenant-Governor who is appointed by the Governor General in Council and is the formal head of Provincial Government, and except that no provincial legislative authority may invade the field allotted by the Act to the Parliament of Canada.

An outline of federal-provincial relations between the Dominion-Provincial Conference of December 1936 and the conclusion of the post-war tax agreements of 1947 will be found in the 1948-49 Year Book, pp. 116-122. Further developments are outlined in the 1951 edition, pp. 102-105.

See list of Special Articles in Chapter XXVIII for reference to the Evolution and Development of the Canadian Constitution and the Terms of Union of Newfoundland with Canada.

Canada's Status in the Commonwealth of Nations.—The several stages in the development of the status of Canada have been authoritatively described in the reports of successive Imperial Conferences including that held at London in 1926, which defined the group of self-governing communities consisting of the United Kingdom and the Dominions as "autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations". That Conference also recognized that, as a consequence of this equality of status, the Governor General of a Dominion "is the representative of the Crown, holding in all essential respects the same position in relation to the administration of public affairs in the Dominion as is held by His Majesty the King in Great Britain", and that "it is the right of the Government of each Dominion to advise the Crown in all matters relating to its own affairs". Simultaneously, with this change in the constitutional relationship between the several parts of the British Commonwealth of Nations, there developed, as a complementary aspect of nationhood, the assumption by the several Dominions of further responsibilities and rights of sovereign States in their relations with other members of the community of nations. Membership in the League of Nations and, more recently, in the United Nations, the exercise of treaty-making powers and the establishment of separate

* For the power of the Federal Parliament to amend the constitution of Canada, see 'The British North America (No. 2) Act, 1949', printed in Vol. II of the *Statutes of Canada* for 1949.

diplomatic representation in a number of foreign countries have characterized this phase in the growth of Canada. More explicit recognition of the implications of the principles of equality of status was accorded in the Statute of Westminster of 1931, which provided for the removal of the remaining limitations on the legislative autonomy of the Commonwealth nations.

Thus Canada, under the Crown, has equality of status with the United Kingdom and the other Commonwealth nations in both domestic and foreign affairs; its government advises the Crown in the person of the Governor General on all matters relating to Canada. Canada has membership in the United Nations; makes its own treaties; appoints its own ambassadors and other representatives abroad; levies its own taxes; makes its own laws which are executed by a government dependent on the will of a majority of the people; and maintains its own military, naval and air forces. In short, Canada has achieved the full status of democratic nationhood within the Commonwealth of Nations.

PART II.—MACHINERY OF GOVERNMENT*

The Federal Parliament consists of the Governor General and the Privy Council (of which the Cabinet, or Ministry, is an active committee responsible to the Legislature for all matters of policy) at the head of the Executive Branch, the Senate and House of Commons comprising the Legislative Branch, and the Courts representing the Judicial Branch of government. There is no clearly defined separation of powers since those members of the Privy Council who are members of the Cabinet have seats in the Legislature, and within that body, in turn, the Senate exercises some judicial functions. Each of the provinces has a similar system. In both Federal and Provincial Governments there is responsible government whereby the Ministry is answerable for its conduct to the elected representatives of the people in the House of Commons or the Legislative Assemblies. This device is not mentioned in the British North America Act but, except for some modifications to meet local conditions, British practice has been followed. Under the constitution the Courts administer the law as it is drawn up and amended by the Legislature.

Section 1.—The Federal Government

Subsection 1.—The Executive

The Governor General.—The Governor General, appointed by the Queen on the advice of the Prime Minister of Canada, traditionally serves for a term of five years. He exercises such authority as is entrusted to him under the Letters Patent constituting the Office of Governor General. Acting under the recommendations of his responsible advisers, and in accordance with the Letters Patent, he summons, prorogues and dissolves Parliament and assents to bills. New Letters Patent were issued under the Great Seal of Canada, effective Oct. 1, 1947, and under them he is empowered to exercise, on the advice of the Queen's Privy Council for Canada, any of the powers and authorities of the Crown in respect of Canada.

* Brought up to Mar. 31, 1952; Federal Government appointments made between that date and the closing off of the volume for press appear in the Annual Register at the end of this publication.

1.—Governors General of Canada since Confederation

Name	Date of Appointment	Date of Assumption of Office
VISCOUNT MONCK, G.C.M.G.	June 1, 1867	July 1, 1867
LORD LISGAR, G.C.M.G.	Dec. 29, 1868	Feb. 2, 1869
The EARL OF DUFFERIN, K.P., K.C.B., G.C.M.G.	May 22, 1872	June 25, 1872
The MARQUIS OF LORNE, K.T., G.C.M.G.	Oct. 5, 1878	Nov. 25, 1878
The MARQUIS OF LANSDOWNE, G.C.M.G.	Aug. 18, 1883	Oct. 23, 1883
LORD STANLEY OF PRESTON, G.C.B.	May 1, 1888	June 11, 1888
The EARL OF ABERDEEN, K.T., G.C.M.G.	May 22, 1898	Sept. 18, 1893
The EARL OF MINTO, G.C.M.G.	July 30, 1898	Nov. 12, 1898
EARL GREY, G.C.M.G.	Sept. 26, 1904	Dec. 10, 1904
FIELD MARSHAL H.R.H. The DUKE OF CONNAUGHT, K.G.	Mar. 21, 1911	Oct. 13, 1911
The DUKE OF DEVONSHIRE, K.G., G.C.M.G., G.C.V.O.	Aug. 19, 1916	Nov. 11, 1916
GENERAL The LORD BYNG OF VIMY, G.C.B., G.C.M.G., M.V.O.	Aug. 2, 1921	Aug. 11, 1921
VISCOUNT WILLINGDON OF RATTON, G.C.S.I., G.C.I.E., G.B.E.	Aug. 5, 1926	Oct. 2, 1926
The EARL OF BESSBOROUGH, G.C.M.G.	Feb. 9, 1931	Apr. 4, 1931
LORD TWEEDSMUIR OF ELSFIELD, G.C.M.G., G.C.V.O., C.H.	Aug. 10, 1935	Nov. 2, 1935
MAJOR-GENERAL The EARL OF ATHLONE, K.G., P.C., G.C.B., G.C.M.G., G.C.V.O., D.S.O.	Apr. 3, 1940	June 21, 1940
FIELD MARSHAL VISCOUNT ALEXANDER OF TUNIS, K.G., G.C.B., G.C.M.G., C.S.I., D.S.O., M.C., A.D.C.	Aug. 1, 1945	Apr. 12, 1946
The Right Honourable VINCENT MASSEY, C.H.	Jan. 24, 1952	Feb. 28, 1952

The Cabinet.—Canada's system of responsible government provides for a Cabinet or Ministry composed of members of the House of Commons or the Senate. The Cabinet is a committee of the Queen's Privy Council for Canada. Without enlarging upon the features of the system, it may be sufficient to note that the Cabinet is responsible to the House of Commons, initiates nearly all the legislation placed before Parliament and, following established precedent, resigns office when it becomes evident that it no longer holds the confidence of the representatives of the people. Its members are chosen by the Prime Minister and each generally assumes charge of one of the various departments of government, although a Minister may hold more than one portfolio at the same time, or may be without portfolio.

2.—Prime Ministers since Confederation

Ministry	Prime Minister	Length of Administration
1	Rt. Hon. Sir JOHN ALEXANDER MACDONALD	July 1, 1867 - Nov. 5, 1873
2	Hon. ALEXANDER MACKENZIE	Nov. 7, 1873 - Oct. 16, 1878
3	Rt. Hon. Sir JOHN ALEXANDER MACDONALD	Oct. 17, 1878 - June 6, 1891
4	Hon. Sir JOHN JOSEPH CALDWELL ABBOTT	June 16, 1891 - Nov. 24, 1892
5	Rt. Hon. Sir JOHN SPARROW DAVID THOMPSON	Dec. 5, 1892 - Dec. 12, 1894
6	Hon. Sir MACKENZIE BOWELL	Dec. 21, 1894 - Apr. 27, 1896
7	Hon. Sir CHARLES TUPPER	May 1, 1896 - July 8, 1896
8	Rt. Hon. Sir WILFRID LAURIER	July 11, 1896 - Oct. 6, 1911
9	Rt. Hon. Sir ROBERT LAIRD BORDEN	Oct. 10, 1911 - Oct. 12, 1917
10	Rt. Hon. Sir ROBERT LAIRD BORDEN	(Conservative Administration) Oct. 12, 1917 - July 10, 1920
11	Rt. Hon. ARTHUR MEIGHEN	(Unionist Administration) July 10, 1920 - Dec. 29, 1921
12	Rt. Hon. WILLIAM LYON MACKENZIE KING	(Unionist—"National Liberal and Conservative Party") Dec. 29, 1921 - June 28, 1926
13	Rt. Hon. ARTHUR MEIGHEN	June 29, 1926 - Sept. 25, 1926
14	Rt. Hon. WILLIAM LYON MACKENZIE KING	Sept. 25, 1926 - Aug. 6, 1930
15	Rt. Hon. RICHARD BEDFORD BENNETT	Aug. 7, 1930 - Oct. 23, 1935
16	Rt. Hon. WILLIAM LYON MACKENZIE KING	Oct. 23, 1935 - Nov. 15, 1948
17	Rt. Hon. LOUIS STEPHEN ST. LAURENT	Nov. 15, 1948 - ...

3.—Members of the Seventeenth Ministry as at Mar. 31, 1952

(According to precedence of Ministers)

NOTE.—A complete list of the members of Federal Ministries from Confederation to 1913 appears in the 1912 Year Book, pp. 422-429. Later Ministries will be found in subsequent editions of the Year Book.

Office	Occupant	Date of First Appointment ¹	Date of Appointment to Present Portfolio
Prime Minister and President of the Queen's Privy Council for Canada.	Rt. Hon. LOUIS STEPHEN ST. LAURENT.....	Dec. 10, 1941	Nov. 15, 1948
Minister of Trade and Commerce and Minister of Defence Production...	Rt. Hon. C. D. HOWE.....	Oct. 23, 1935	Jan. 19, 1948 Mar. 22, 1951
Minister of Agriculture.....	Rt. Hon. J. G. GARDINER.....	Oct. 28, 1935	Oct. 28, 1935
Minister of Public Works.....	Hon. ALPHONSE FOURNIER.....	Oct. 6, 1942	Oct. 6, 1942
Minister of National Defence.....	Hon. BROOKE CLAXTON.....	Oct. 13, 1944	Dec. 12, 1946
Minister of Transport.....	Hon. LIONEL CHEVRIER.....	Apr. 18, 1945	Apr. 18, 1945
Minister of National Health and Welfare.....	Hon. PAUL MARTIN.....	Apr. 18, 1945	Dec. 12, 1946
Minister of Finance and Receiver General.....	Hon. D. C. ARBOTT.....	Apr. 18, 1945	Dec. 10, 1946
Minister of National Revenue.....	Hon. J. J. McCANN.....	Apr. 18, 1945	Apr. 18, 1945
Leader of the Government in the Senate.....	Hon. WISHART McL. ROBERTSON.....	Aug. 29, 1945	Aug. 29, 1945
Minister of Labour.....	Hon. M. F. GREGG.....	Jan. 19, 1948	Aug. 7, 1950
Minister of Fisheries.....	Hon. R. W. MAYHEW.....	June 11, 1948	June 11, 1948
Secretary of State for External Affairs.....	Hon. L. B. PEARSON.....	Sept. 10, 1948	Sept. 10, 1948
Minister of Justice and Attorney General.....	Hon. S. S. GARSON.....	Nov. 15, 1948	Nov. 15, 1948

Minister of Citizenship and Immigration.....	Hon. W. E. HARRIS.....	Jan. 18, 1950	Jan. 18, 1950
Minister of Mines and Technical Surveys.....	Hon. GEORGE PRUDHAM.....	Dec. 13, 1950	Dec. 13, 1950
Postmaster General.....	Hon. ALCIDE CÔTÉ.....	Feb. 13, 1952	Feb. 13, 1952

¹ Appointee was not necessarily sworn in on date given.

Administrative duties in the various departments of government became so burdensome during World War II that Parliamentary Assistants were appointed to assist six Cabinet Ministers with their parliamentary duties. The practice was extended after the War to include Parliamentary Assistants for 13 Ministers, as listed below:—

To Minister of Trade and Commerce.....	G. J. McILRAITH
To Minister of Labour.....	PAUL E. CÔTÉ
To Minister of Agriculture.....	ROBERT McCUBBIN
To Minister of Fisheries.....	J. WATSON MACNAUGHT
To Minister of Veterans Affairs.....	L. A. MUTCH
To Minister of National Defence.....	J. A. BLANCHETTE
To Minister of Finance.....	JAMES SINCLAIR
To Minister of Transport.....	W. M. BENIDICKSON
To Postmaster General.....	L. LANGLOIS
To Secretary of State for External Affairs.....	JEAN LESAGE
To Minister of National Defence.....	R. O. CAMPNEY
To Minister of National Health and Welfare.....	E. A. McCUSKER
To Minister of Defence Production.....	JOHN H. DICKEY

The Privy Council.—The Queen's Privy Council for Canada is composed of about seventy members who are sworn of the Council by the Governor General, on the advice of the Prime Minister, and who retain their membership for life. The Council consists, chiefly, of present and former Ministers of the Crown. It does not meet as a functioning body and its constitutional responsibilities as adviser

to the Crown in respect to Canada are performed exclusively by the Ministers who constitute the Cabinet of the day and serve as the Committee of the Queen's Privy Council for Canada.

4.—Members of the Queen's Privy Council for Canada, According to Seniority Therein,¹ as at Mar. 31, 1952

Clerk of the Privy Council and
Secretary to the Cabinet..... N. A. ROBERTSON
Assistant Clerk..... A. M. HILL

NOTE.—In this list the prefix "The Rt. Hon." indicates membership in the United Kingdom Privy Council. Besides those mentioned in this list, The Rt. Hon. Sir Lyman P. Duff, G.C.M.G., retired Chief Justice of Canada, and The Rt. Hon. Thibaudeau Rinfret, Chief Justice of Canada, are members of the United Kingdom Privy Council.

¹ The ordinary legal limit of duration for each Parliament is five years. ² Duration of Parliament in years, months and days. The life of a Parliament is counted from the date of return of election writs to the date of dissolution, both days inclusive (B.N.A. Act, Sect. 50). ³ Date of general election. ⁴ Writs returnable. ⁵ Dissolution of Parliament. ⁶ During the war years Parliament was kept in almost continuous session. When prorogation took place it was followed immediately by a new session. During long adjournments provision was made whereby the Speaker could reconvene Parliament before the date previously set for reassembly.

Subsection 2.—The Legislature

The Legislative Branch of government, consisting of the Senate and House of Commons, is responsible for the enactment of all legislation. Bills may originate in either the Senate or the House subject to the provisions of Sect. 53 of the British North America Act, 1867, which restricts to the House of Commons the introduction of Bills for the appropriation of any part of the public revenue or the imposition of any tax or impost. Bills must pass both Houses and receive the Royal Assent before becoming law. In practice most Public Bills originate in the House of Commons, although there has been a marked increase recently in the introduction of Public Bills in the Senate. For some years past, all Private Bills have originated in the Senate.

The Senate.—From an original membership of 72 at Confederation, the Senate, through the addition of new provinces and the general growth of population, now has 102 members, the latest change in representation having been made on the admission of Newfoundland to Confederation in 1949. The growth of representation in the Senate is traced in the 1940 Year Book, pp. 47-49, and is summarized by provinces in Table 6.

The House of Commons.—In Sect. 37 of the British North America Act of 1867 it was provided that "The House of Commons shall, subject to the provisions of this Act, consist of one hundred and eighty-one members, of whom eighty-two shall be elected for Ontario, sixty-five for Quebec, nineteen for Nova Scotia, and fifteen for New Brunswick". Further, under Sect. 51, it was enacted that, after the completion of the Census of 1871 and of each subsequent decennial census, the representation of the four provinces should be readjusted by such authority, in such manner, and from such time, as the Parliament of Canada provided, subject to and according to certain rules set out in the original Act.

The representation of the provinces in the Federal Parliament as at 1867 and the readjustments that took place with the admission of the newer provinces into Confederation and with each decennial census up to 1931, are outlined in the 1946 Year Book, pp. 57-59. The postponement of redistribution of parliamentary constituencies following the 1941 Census, together with the petition of both Houses of Parliament to the Imperial Parliament requesting the required amendment to Sect. 51 of the British North America Act, the wording of the new Section, and the passage of the Representation Act, 1947 (11 Geo. VI, c. 71), providing for an increase of membership from 245 to 255 effective at the following general election, are described in the Year Book 1951, p. 65.

Under the terms of a Bill, assented to on Feb. 18, 1949, and entitled "An Act to approve the Terms of Union of Newfoundland with Canada", provision was made for the Province of Newfoundland to be represented by seven members in the House of Commons. This increased the number of Members of Parliament to 262.

The number of representatives of each province elected at each of the 21 general elections since Confederation is given in Table 8.

The completion of the 1951 Census called for further readjustment of parliamentary representation and draft legislation for amending the British North America Acts, 1867-1951, with respect to the readjustment of representation in the House of Commons was under consideration by the Canadian Parliament in the spring of 1952. An outline of this legislation, if enacted by the time of going to press, will be given in an Appendix to this volume.

The Opposition.—The Opposition occupies an essential place in constitutions based on the British Parliamentary System. Like many other institutions such as that of the premiership, for instance, it takes its place with the unwritten customs, tested by time, that have been accepted and become firmly established.

The choice of the Canadian electorate not only determines who shall govern Canada but, by deciding which party receives the second largest number of seats

in the House of Commons, it designates which of the major parties becomes the Official Opposition. The function of the Leader of the Opposition is to offer intelligent and constructive criticism of the government of the day.

When criticism by the Opposition becomes sufficiently effective it can overthrow the existing government and the Leader of the Opposition might then, as a result of the ensuing election, become Prime Minister.

Although the position of Leader of the Opposition is not recognized in the British North America Act, it received statutory acknowledgment in Canada in 1927. The Senate and House of Commons Act of that year provided for an annual salary to be paid to the Leader of the Opposition in addition to his indemnity as a Member of the House. (See pp. 59-60.)

9.—Electoral Districts, Voters on List and Votes Polled, Names and Addresses of Members of the House of Commons, as Elected at the Twenty-First General Election, June 27, 1949, and Revised to Mar. 31, 1952.

Speaker..... The Hon. W. ROSS MACDONALD

Clerk of the House..... LEON J. RAYMOND

Leader of the Opposition..... GEORGE A. DREW

NOTE.—This information, except the population of constituencies, has been supplied by the Chief Electoral Officer, Ottawa. Party affiliations are unofficial. The vote is summarized by provinces in Table 11, p. 61. The leaders of the political parties are indicated by asterisks(*). For Parliamentary Assistants see p. 47.

Indemnities and Allowances.—Members of the Senate receive a sessional indemnity of \$4,000. In addition, they receive an annual expense allowance of \$2,000, paid at the end of each calendar year. Members of the House of Commons are paid a sessional indemnity of \$4,000. In addition, they receive \$2,000 as an annual expense allowance, paid at the end of each calendar year. This allowance, except in the case of Ministers of the Crown and the Leaders of the Opposition in the House and in the Senate, is not subject to income tax. The remuneration of

a Cabinet Minister is \$10,000 a year, the Prime Minister receiving \$15,000, in addition to the sessional indemnity and expense allowance each receives as a Member of Parliament. The Leader of the Opposition also receives \$10,000 a year in addition to his sessional indemnity and expense allowance. Cabinet Ministers are also entitled to a motor-car allowance of \$2,000. The Speakers of the Senate and of the House of Commons receive, besides their sessional indemnity and expense allowance, a salary of \$6,000 and a motor-car allowance of \$1,000 and are also entitled to \$3,000 in lieu of residence. The Deputy Speaker of the House of Commons receives a salary of \$4,000 and an allowance in lieu of a residence of \$1,500. Parliamentary Assistants to the Ministers of the Crown, of whom there were 13 at Mar. 31, 1952, receive \$4,000 sessional indemnity as Members of Parliament, \$4,000 a year as Parliamentary Assistants and the \$2,000 allowed to all other Members of Parliament.

The Federal Government Franchise.—Legislation concerning the right to vote at federal elections is outlined in the 1947 Year Book, pp. 72-73.

The present franchise laws are contained in the Canada Elections Act, 1938 (2 Geo. VI, c. 46, as amended by 6 Geo. VI, c. 26; 12 Geo. VI, c. 46; and 14 Geo. VI, c. 35). The franchise is conferred upon all Canadian citizens or British subjects, men and women, who have attained the age of 21 years and who have been ordinarily resident in Canada for 12 months prior to polling day at a federal election, and ordinarily resident in the electoral district on the date of the issue of the writ ordering such election. Classes of persons denied the right to vote are:—

- (1) Judges appointed by the Governor General in Council;
- (2) The returning officer for each electoral district;
- (3) Persons undergoing punishment as inmates of any penal institution for the commission of any offence;
- (4) Indians ordinarily resident on an Indian Reserve who did not serve in World Wars I or II, or who did not execute a waiver of exemption under the Indian Act from taxation on and in request of personal property;
- (5) Persons restrained of their liberty or management of their property by reason of mental disease;
- (6) Doukhobors, residing in the Province of British Columbia, whether born in Canada or elsewhere, excepting those who have served in the naval, military, or air forces [of Her Majesty] in any war, and their wives and descendants;
- (7) Persons disqualified under any law relating to the disqualification of electors for corrupt and illegal practices.

The Act to amend the Canada Elections Act, passed on June 15, 1948, removed the provisions previously in effect which disqualified Japanese or other persons by reason of race from voting at federal elections, also inmates of institutions maintained by any government or municipality for the housing of the poor.

Regulations, known as the Canadian Defence Service Voting Regulations, were drawn up and promulgated in 1948 prescribing voting procedure for personnel of the Permanent Force of the Army, Navy and Air Force. The regulations provide that these voters cast their ballots for candidates in the constituency in which they last resided prior to enlistment.

11.—Voters on the Lists and Votes Polled at the Federal General Elections of 1935, 1940, 1945 and 1949

NOTE.—Corresponding statistics for the general elections of 1911, 1917, 1921 and 1925 will be found at p. 82 of the 1926 Year Book; those for 1926 at p. 66 of the 1945 edition; and those for 1930 at p. 94 of the 1948-49 edition.

¹ Each voter in the double-member constituency of Queens County, P.E.I., had two votes; in 1949, 25,505 voters on the list cast 41,627 votes. ² Each voter in the double-member constituency of Halifax, N.S., had two votes; in 1949, 90,803 voters on the list cast 114,201 votes. ³ Yukon-Mackenzie River Constituency includes part of Northwest Territories.

Subsection 3.—The Judiciary

The Federal Judiciary

The Parliament of Canada is empowered by Sect. 101 of the British North America Act to provide from time to time for the constitution, maintenance and organization of a general Court of Appeal for Canada and for the establishment of any additional courts for the better administration of the laws of Canada. Under this provision the Parliament of Canada has established the Supreme Court of Canada, the Exchequer Court of Canada and certain miscellaneous courts.

Supreme Court of Canada.—This Court, first established in 1875 and now governed by the Supreme Court Act (R.S.C. 1927, c. 35, as amended in 1949), consists of a chief justice, who is called the Chief Justice of Canada, and eight puisne judges. The chief justice and the puisne judges are appointed by the Governor in Council and they hold office during good behaviour but are removable by the Governor General on address of the Senate and House of Commons and they cease to hold office upon attaining the age of 75 years. The Court sits at Ottawa and exercises general appellate jurisdiction throughout Canada in civil and criminal cases. The Court is also required to consider and advise upon questions referred to it by the Governor in Council and it may also advise the Senate or House of Commons on Private Bills referred to the Court under any rules or orders of the Senate or House of Commons.

Appeals may be brought from any final judgment of the highest court of final resort in a province in any case where the amount or value of the matter in controversy exceeds the sum of \$2,000. An appeal may be brought from any other final judgment with leave of the highest court of final resort in the province; if such court refuses to grant leave, the Supreme Court of Canada may grant leave to appeal. The Supreme Court may grant leave to appeal from any judgment, whether final

or not. Appeals in respect of indictable offences are regulated by Sects. 1023 and 1025 of the Criminal Code. Appeals from federal courts are regulated by the statute establishing such courts.

The judgment of the Supreme Court of Canada in all cases is final and conclusive.

12.—Chief Justice and Judges of the Supreme Court of Canada as at Mar. 31, 1952

(In order of seniority)

Name	Date of Appointment
The Rt. Hon. Chief Justice THIBAUDEAU RINFRET.....	Jan. 8, 1944
The Hon. Justice PATRICK KERWIN.....	July 20, 1935

The Hon. Justice JOHN R. CARTWRIGHT.....	Dec. 23, 1949
The Hon. Justice J. H. GERALD FAUTEUX.....	Dec. 23, 1949

Exchequer Court.—The Exchequer Court of Canada was first established in 1875 as part of the Supreme Court of Canada but is now a separate court governed by the Exchequer Court Act (R.S.C. 1927, c. 34). The Court consists of a president and four puisne judges who are appointed by the Governor in Council. The president and the puisne judges hold office during good behaviour but may be removed by the Governor General on address of the Senate and House of Commons. They cease to hold office upon attaining the age of 75 years. One of the puisne judges is the Chief Commissioner of the Board of Transport Commissioners. The Court sits at Ottawa and also at any other place in Canada for which sittings may be fixed by the Court. The jurisdiction of the Court extends to cases where claims are made by or against the Crown in right of Canada. Proceedings against the Crown are taken by petition of right pursuant to the Petition of Right Act (R.S.C. 1927, c. 158). Before proceedings can be taken against the Crown a fiat must be obtained from the Governor General.

An appeal lies to the Supreme Court of Canada from any final judgment of the Exchequer Court in which the amount in controversy exceeds \$500; an appeal also lies with leave of the Supreme Court in certain cases where the amount in controversy does not exceed \$500 or where the judgment is not final.

The Exchequer Court also exercises admiralty jurisdiction in Canada. Admiralty jurisdiction was first conferred in 1891 by the Admiralty Act (54-55 Vict., c. 29) and the admiralty jurisdiction is now governed by the Admiralty Act (24-25 Geo. V, c. 31). Under this statute the Exchequer Court is continued as a Court of Admiralty. The president and puisne judges of the Exchequer Court exercise admiralty jurisdiction throughout the whole of Canada. In addition, Canada is divided into various admiralty districts; a district judge in admiralty is appointed for each district. Appeals to the Supreme Court of Canada from judgments of the president or the puisne judges are governed by the general appeal provisions in the Exchequer Court Act. Appeals may be taken from a final judgment of a district judge in admiralty either to the Exchequer Court or directly to the Supreme Court of Canada.

Miscellaneous Courts.—*Railway Act.*—The Railway Act (R.S.C. 1927, c. 170) established the Board of Railway Commissioners for Canada as a court of record; by the Transport Act, 1938 (2 Geo. VI, c. 53), the name was changed to the Board of Transport Commissioners for Canada. This Court exercises jurisdiction with respect to railway matters. The Governor in Council is given jurisdiction to vary any order of the Board and an appeal lies from the Board to the Supreme Court of Canada upon a question of jurisdiction or a question of law.

Bankruptcy Act.—By virtue of para. 21 of Sect. 91 of the British North America Act, Parliament has exclusive legislative jurisdiction in relation to bankruptcy and insolvency. By the Bankruptcy Act (13 Geo. VI, c. 7) the superior courts of the provinces are constituted bankruptcy courts; original jurisdiction is conferred upon the trial courts and appellate jurisdiction is conferred upon the appeal courts of the provinces.

Farmers' Creditors Arrangement Act.—Under the Farmers' Creditors Arrangement Act, 1943 (7 and 8 Geo. VI, c. 26), the county or district courts of the provinces are established as courts for the purposes of this Act and the appeal courts of the provinces are given appellate jurisdiction.

Income Tax Appeal Board.—By the Income Tax Act (11-12 Geo. VI, c. 52) an Appeal Board is established, consisting of a chairman and not less than two or more than four members, with jurisdiction over appeals against income tax assessments. A further appeal may be taken to the Exchequer Court.

Provincial Judiciaries

Certain provisions of the British North America Act govern, to some extent, the provincial judiciaries. Under Sect. 92 (14) the legislature of each province may exclusively make laws in relation to the administration of justice in the province including the constitution, maintenance and organization of provincial courts, both of civil and criminal jurisdiction. Sect. 96 provides that the Governor General in Council shall appoint the judges of the superior, district and county courts in each province, except those of the courts of probate in Nova Scotia and New Brunswick. Sect. 100 provides that the salaries, allowances and pensions of judges of the superior, district and county courts (except the courts of probate in Nova Scotia and New Brunswick) are to be fixed and provided by the Parliament of Canada and these are set out in the Judges Act, 1946 (10 Geo. VI, c. 56). Under Sect. 99 the judges of the superior courts hold office during good behaviour, but are removable by the Governor General on address of the Senate and House of Commons. The tenure of office of district and county court judges is fixed by Sect. 33 of the Judges Act, 1946, as being during good behaviour and their residence within the county or union of counties for which the court is established.

Further details of provincial judiciaries are given in the 1951 Year Book, pp. 76-82.

Section 2.—Provincial and Territorial Governments

In each of the provinces, the Queen is represented by a Lieutenant-Governor appointed by the Governor General in Council. The Lieutenant-Governor acts on the advice and with the assistance of his Ministry or Executive Council, which is responsible to the Legislature and resigns office when it ceases to enjoy the confidence of that body.

The Legislature of each province is unicameral, consisting of a Legislative Assembly, except for the Province of Quebec where there is a Legislative Council as well as a Legislative Assembly.

The Legislative Assembly is elected by the people for a statutory term of five years but may be dissolved within that period by the Lieutenant-Governor on the advice of the Premier of the province.

¹ The area of Ontario was extended by the Ontario Boundaries Extension Act, 1912 (2 Geo. V, c. 40).

² Extended by Quebec Boundaries Extension Act, 1912 (2 Geo. V, c. 45), and diminished Mar. 1, 1927, in consequence of the Award of the Judicial Committee of the British Privy Council, whereby approximately 112,000 sq. miles of territory (formerly considered as part of Quebec) was assigned to Newfoundland.

³ Extended by the Extension Boundaries Act of Manitoba, 1881, and the Manitoba Boundaries Extension Act, 1912 (2 Geo. V, c. 32).

⁴ Saskatchewan and Alberta created as provinces in 1905 from the area formerly comprised in the provisional Districts of Assiniboia, Athabaska, Alberta and Saskatchewan, established May 17, 1882, by minute of Canadian Privy Council, concurred in by Dominion Parliament and Order in Council, Oct. 2, 1895.

⁵ Established as a provisional District in the Northwest Territories in 1895 and proclaimed the Yukon Judicial District on Aug. 16, 1897; was separated from the Northwest Territories and constituted the Yukon Territory in June 1898.

⁶ Rupert's Land, acquired under the Rupert's Land Acts 1867-68, and the undefined Northwestern Territory were transferred by the Imperial Government to be admitted into union with Canada as the North West Territories by Order in Council June 23, 1870 (effective July 15, 1870). The Northwest Territories were defined by the Northwest Territories Amendment Act, 1905, as that part of Rupert's Land and Northwestern Territory except such portions thereof as form Manitoba, Saskatchewan, Alberta, the District of Keewatin and Yukon Territory. In 1912, part of Rupert's Land (the District of Ungava) was annexed to Quebec and the remainder, south and west of James and Hudson Bays as far north as the 60th parallel, to Ontario and Manitoba.

⁷ Established as provincial Districts in 1895.

⁸ The District of Keewatin, created in 1876, was withdrawn from the Government of the Northwest Territories until July 24, 1905, when it was enlarged by those portions of the Districts of Saskatchewan and Athabaska not included in the Province of Saskatchewan and placed under the jurisdiction of the reorganized Northwest Territories.

The source of the powers of the Provincial Governments of Canada is the British North America Act, 1867 (30-31 Vict., c. 3 and amendments). Under Sect. 92 of the Act, the Legislature of each province may exclusively make laws in relation to the following matters: amendment of the constitution of the province except as regards the office of Lieutenant-Governor; direct taxation within the province; borrowing of money on the sole credit of the province; establishment and tenure of provincial offices and appointment and payment of provincial officers; the management and sale of public lands belonging to the province and of the timber and wood thereon; the establishment, maintenance and management of public and reformatory prisons in and for the province; the establishment, maintenance and management of hospitals, asylums, charities and eleemosynary institutions in and for the province, other than marine hospitals; municipal institutions in the province; shop, saloon, tavern, auctioneer and other licences issued for the raising of provincial, local or municipal revenue; local works and undertakings other than interprovincial or international lines of ships, railways, canals, telegraphs, etc., or works which, though wholly situated within one province, are declared by the Federal Parliament to be for the general advantage either of Canada or of two or more provinces; the incorporation of companies with provincial objects; the solemnization of marriage in the province; property and civil rights in the province; the administration of justice in the province, including the constitution, maintenance and organization of provincial courts both of civil and criminal jurisdiction, and including procedure in civil matters in those courts;* the imposition of punishment by fine, penalty, or imprisonment for enforcing any law of the province relating to any of the aforesaid subjects; and generally all matters of a merely local or private nature in the province.

Further, in and for each province the Legislature may, under Sect. 93, make laws exclusively in relation to education, subject to certain provisions. The purpose of these provisions was to preserve to a religious minority in any province the same privileges and rights in regard to education which it had at the date of Confederation, but the Provincial Legislature was not debarred from legislating on the subject of separate schools providing it did not thereby prejudicially affect privileges enjoyed before Confederation by such schools in the province. These powers, given to the four original provinces in Confederation, have, with some slight changes, been retained ever since and the more recently admitted provinces have assumed the same rights and responsibilities on their inclusion as units in the federation as were previously enjoyed by the older provinces.

Provincial Franchise.—The main qualifications for persons entitled to be registered as voters in provincial elections are given below and apply, with minor modifications, to voters in all provinces:—

Every person, male or female, at the age of 21 years, who is a British subject or a Canadian citizen and was resident in the province of registration 12 months prior to the election date and with two months residence in the electoral district of polling, and who falls under no statutory disqualification, is entitled to be registered as a voter.

The principal exception to the above gives voting privileges to persons in Saskatchewan and Alberta at the age of 18 years and 19 years, respectively.

Residence required in the Province of Quebec for provincial elections is two years and in British Columbia six months. In Manitoba a residence period of three months in the electoral district is necessary for registration. Further details connected with disqualifications, etc., may be found in the Election Act of each of the provinces.

* A description of the provincial courts is given in the 1951 Year Book, pp. 76-82.

Subsection 1.—Newfoundland

The Government of Newfoundland consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly. Colonel the Honourable Sir Leonard Outerbridge is the present Lieutenant-Governor of the Province and was commissioned on Aug. 17, 1949.

The Legislative Assembly has 28 members elected for a term of five years.

The Premier and each Cabinet Minister receives a salary of \$7,000 per annum plus a sessional indemnity of \$3,000. Each Member of the House of Assembly receives a sessional indemnity of \$3,000. An allowance of \$2,000 is made to the Leader of the Opposition.

14.—Legislatures of Newfoundland, 1949-52, and Ministry as at Mar. 31, 1952

Subsection 2.—Prince Edward Island

The Government of Prince Edward Island consists of a Lieutenant-Governor, an Executive Council and a Legislative Assembly.

The Honourable T. W. L. Prowse, the present Lieutenant-Governor of the Province, was commissioned to office on Oct. 4, 1950. Lieutenant-Governors since Confederation are cited in the Year Book 1951, p. 86.

The Legislative Assembly has 30 members who serve for a statutory term of five years, 15 of whom are elected on a basis of adult suffrage and the other 15 elected by property holders only.

The salary of the Premier is \$6,000 and the salaries of the Cabinet Ministers are as follows: Attorney and Advocate General and Provincial Treasurer, \$4,500; Minister of Health and Welfare, Minister of Public Works and Highways, Minister of Industry and Natural Resources, Minister of Agriculture, \$4,000 each; Minister of Education and Provincial Secretary, \$3,000 each. Each Member of the Assembly is paid the sum of \$1,000 for each session attended by him and an additional amount of \$500, tax free, as indemnity for expenses incurred. The Speaker is paid a further additional sum of \$400 and an additional amount of \$200, tax free, for indemnity incurred, and the Leader of the Opposition is paid a further additional sum of \$800 and an additional amount of \$200, tax free, for indemnity incurred by him in relation to his official duties.

15.—Legislatures and Premiers of Prince Edward Island, 1935-52, and Ministry as at Mar. 31, 1952

Legislatures, 1935-52¹

Date of Election	Legislature	Number of Sessions	Date of First Opening	Date of Dissolution

Provincial Secretary.....	Hon. J. WILFRID ARSENAULT.....	Feb. 12, 1948	Oct. 13, 1949
Minister without portfolio.....	Hon. KEIR CLARK.....	June 16, 1951	June 16, 1951
Minister without portfolio.....	Hon. J. BRENTON ST. JOHN.....	June 16, 1951	June 16, 1951

Subsection 3.—Nova Scotia

The Government of the Province of Nova Scotia has a Lieutenant-Governor, an Executive Council and a House of Assembly.

The Honourable J. A. D. McCurdy, the present Lieutenant-Governor, was commissioned to office Aug. 12, 1947. Lieutenant-Governors since Confederation are cited in the Year Book 1951, p. 87.

The House of Assembly has 37 members elected for five years, the maximum duration of its existence.

The Premier of the Province receives a salary of \$9,000 per annum and each Cabinet Minister a salary of \$8,000 per annum. Each Member of the House of Assembly receives a sessional indemnity of \$1,600 and an allowance of \$800 for expenses incidental to the discharge of his duties. The Leader of the Opposition receives an allowance of \$1,000 in addition to his sessional indemnity.

16.—Legislatures and Premiers of Nova Scotia, 1933-52, and Ministry as at Mar. 31, 1952

Subsection 4.—New Brunswick

The Government of New Brunswick has a Lieutenant-Governor, an Executive Council and a House of Assembly.

The Honourable David Laurence MacLaren, the present Lieutenant-Governor, was commissioned to office Nov. 1, 1945. Lieutenant-Governors since Confederation are cited in the Year Book 1951, p. 89.

The Legislative Assembly has 52 members who are elected for a statutory term of five years.

The Premier receives a salary of \$5,000 in addition to the salary for any other portfolio he may hold. The salary of each Cabinet Minister is \$5,000, the amount paid as indemnity to each Member of the House of Assembly is \$1,500, and the Leader of the Opposition receives an additional \$2,000. An allowance of \$1,000, in addition to the regular indemnity, is made to the Speaker.

Subsection 5.—Quebec

The Government of Quebec consists of the Lieutenant-Governor, an Executive Council, and a bicameral legislature—the Legislative Council and the Legislative Assembly.

The Honourable Gaspard Fauteux, the present Lieutenant-Governor, was commissioned to office Oct. 3, 1950. Lieutenant-Governors since Confederation are cited in the Year Book 1951, p. 90.

The Legislative Council has 24 members nominated for life by the Lieutenant-Governor in Council. The Legislative Assembly has 92 members and, like the Legislative Council, has the power to bring forward bills relating to civil and administrative matters and to the amendment or repeal of laws that already exist. A Bill, to be approved by the Lieutenant-Governor, must have received the assent of both Houses. Only the Legislative Assembly can bring forward a Bill requiring the expenditure of public money. The maximum life of a Legislature is five years.

Salaries and allowances of the Premier, Members of the Executive Council, Legislative Council and Legislative Assembly are fixed according to the R.S.Q. 1941, c. 4, as amended by 10 Geo. VI, c. 11, as follows: all Members of the Legislative Assembly and Legislative Council receive \$3,000 per annum as salary and \$1,000 by way of allowances; in addition, the Premier receives \$10,000 as salary and \$4,000 allowances; Ministers with portfolio an additional \$6,000 as salary and \$2,000 allowances; Ministers without portfolio an additional \$2,000 salary and \$2,000 allowances; the Leader of the Opposition in the Legislative Assembly an additional \$6,000 salary and \$2,000 allowances; and the Leader of the Opposition in the Legislative Council an additional \$2,000 allowances.

18.—Legislatures and Premiers of Quebec, 1931-52, the Ministry and Members of the Legislative Council, as at Mar. 31, 1952

Subsection 6.—Ontario

The Government of Ontario consists of the Lieutenant-Governor, the Executive Council and the House of Assembly. The Honourable Louis O. Breithaupt, the present Lieutenant-Governor of the Province, was commissioned to office Jan. 24, 1952. Lieutenant-Governors since Confederation are cited in the Year Book 1951, p. 92.

The House of Assembly, the single-chamber Legislature of the Province, is composed of 90 members elected for a statutory term of five years on an adult-suffrage basis.

Besides the regular departments of government, the Niagara Parks Commission, the Ontario Municipal Board, the Hydro-Electric Power Commission of Ontario, the Ontario Northland Transportation Commission, the Liquor Control Board and the Liquor Licence Board have been created.

Under the provisions of the Legislative Assembly Act (R.S.O. 1950, c. 202, as amended 1952, c. 51), each Member of the Assembly is paid an annual indemnity of \$2,600 and an allowance for expenses of \$1,300. In addition, the Speaker receives a special indemnity at the annual rate of \$3,000 and an expense allowance of \$2,000; the Chairman of the Committee of the Whole a special indemnity at the annual rate of \$1,000 and the Leader of the Opposition a special indemnity of \$3,000 and an annual allowance of \$2,000 for expenses. Each Member of the Cabinet receives the ordinary indemnity as a Member of the Legislature of \$2,600 plus the \$1,300 expense allowance in addition to his salary as a Minister of the Crown. The salary provided in the Executive Council Act for a Cabinet Minister is \$10,000.

19.—Legislatures and Premiers of Ontario, 1934-52, and Ministry as at Mar. 31, 1952

Subsection 7.—Manitoba

Besides its Lieutenant-Governor, Manitoba has a Provincial Executive composed of 10 members and a Legislative Assembly of 57 members, elected for a statutory term of five years. The Honourable Roland Fairbairn McWilliams, the present Lieutenant-Governor of the Province, was commissioned to office Nov. 1, 1940. Lieutenant-Governors since Confederation are cited in the Year Book 1951, p. 94.

The Premier of the Province is paid a salary of \$8,000 per annum and each of the other Members of the Cabinet \$6,000. Members of the Legislature are each paid an indemnity of \$1,670 and an expense allowance of \$830. The Leader of the Opposition is paid an additional amount of \$2,000 and the Speaker of the Legislature an additional amount of \$2,500.

20.—Legislatures and Premiers of Manitoba, 1932-52, and Ministry as at Mar. 31, 1952

Legislatures, 1932-52¹

Date of Election	Legislature	Number of Sessions	Date of First Opening	Date of Dissolution

Subsection 10.—British Columbia

The Government of British Columbia has a Lieutenant-Governor, an Executive Council and a Legislative Assembly.

Colonel the Honourable Clarence Wallace, the present Lieutenant-Governor of the Province, was commissioned to office Oct. 1, 1950. Lieutenant-Governors since Confederation are cited in the Year Book 1951, p. 98.

The Legislative Assembly, elected for a statutory term of five years, has 48 members.

Members of the Executive Council and the Legislative Assembly each receive sessional allowances of \$2,000 and \$1,000 for expenses. In addition, the Premier receives a salary of \$9,000 and each Member of the Executive Council \$7,500. The Leader of the Opposition has a special allowance of \$2,000 and the Speaker and Deputy Speaker receive allowances of \$1,800 and \$500, respectively.

23.—Legislatures and Premiers of British Columbia, 1933-52, and Ministry as at Mar. 31, 1952

Legislatures, 1933-52¹

Date of Election	Legislature	Number of Sessions	Date of First Opening	Date of Dissolution
Nov. 2, 1933 ²	18th General Assembly.....	4	Feb. 20, 1934	Apr. 15, 1937

Minister of Labour and Minister of Mines.....	Hon. JOHN HENRY CATES.....	July 21, 1949	July 21, 1949
Minister of Education.....	Hon. WILLIAM THOMAS STRAITH...	Dec. 29, 1947	Dec. 29, 1947
Minister of Health and Welfare, Minister of Municipal Affairs and Minister of Trade and Industry.	Hon. ALEXANDER DOUGLAS TURNBULL.....	May 3, 1950	May 3, 1950

Subsection 11.—Yukon and the Northwest Territories

Yukon Territory.—The Yukon Act provides for a local government composed of a Chief Executive, styled Commissioner, who is appointed by the Governor in Council, and an elective Territorial Council of three members having a three-year tenure of office.* The Yukon Territorial Council performs much the same functions as do the Provincial Governments. The Commissioner is the counterpart of a Provincial Cabinet and the three members of the Territorial Council are the counterpart of a Provincial Legislature. The seat of local government is at Dawson, but the Commissioner acts under instructions from the Governor in Council or the Minister of Resources and Development at Ottawa.

COMMISSIONER

FRED FRASER..... Oct. 15, 1951

TERRITORIAL COUNCIL

(Members elected 1949, for three years)

Dawson District..... CHARLES J. LELIÈVRE
Whitehorse District..... R. GORDON LEE
Mayo District..... ERNEST J. CORP

* A 1951 amendment to the Yukon Act (15 Geo. VI c. 23) proclaimed in August 1952, provides for five elective members on the Council.

Northwest Territories.—The Government of the Northwest Territories is vested in a Commissioner, assisted by a Council composed of eight members one of whom is Deputy Commissioner. Five of the members are appointed by the Governor in Council and three are elected to represent electoral districts in the Mackenzie District. The administration of the various Acts, Ordinances and Regulations pertaining to the Northwest Territories is supervised by the Director of the Northern Administration and Lands Branch of the Department of Resources and Development. The seat of government is at Ottawa. The Council meets once a year at Ottawa and once a year at a point within the Territories. The First Session of this partially elected eight-member Council of the Northwest Territories was held at Yellowknife on Dec. 10, 1951.

TERRITORIAL COUNCIL (as at Mar. 31, 1952)

Commissioner	MAJOR-GENERAL HUGH A. YOUNG
Members of the Council—	
Appointed.....	FRANK J. G. CUNNINGHAM (Deputy Commissioner)
	LOUIS C. AUDETTE, WILLIAM I. CLEMENTS, DONALD M. MACKAY, and LEONARD H. NICHOLSON
Elected.....	JAMES BRODIE, FRANK CARMICHAEL, and MERVIN HARDIE
Officers of the Council—	
Secretary.....	ROBERT BOUCHARD
Legal Adviser.....	WM. NASON

Section 3.—Municipal Government*

The earliest local government in Canada was carried out by the seigneurs of New France who bore, along with military command and the administration of justice, the responsibilities of appointing justices of the peace and clerks of roads. Some of these officers were soon replaced by a 'syndic' elected by the people, the first in 1644, though a mayor and two aldermen had held office briefly in the City of Quebec in 1643. However, the syndics fell into disuse, and such powers were delegated by the Governor to officials. The City of Quebec was incorporated in 1832, and a system of local government for the Province, decreed in 1840, was remodelled by Acts of 1845, 1847, 1850 and 1860.

In the Atlantic Provinces, Saint John, N.B., had attained the distinction of becoming Canada's first incorporated city in 1785. Incorporation of Halifax, N.S., came in 1841 and Charlottetown, P.E.I., in 1855. In Newfoundland, St. John's was created a town in 1888.

The Ontario Parish and Town Officers Act of 1793 provided for an annual meeting in a parish or township to appoint local officers responsible to Parliament and the courts and the meetings had no law-making powers. Brockville, in 1832, gained some local powers from the Governor in Council which had previously been exercised through the courts. In 1834, York was incorporated as the self-governing City of Toronto. The Municipal Act of 1849 became the foundation of the local government in Ontario and later provided a model for the western provinces. Subsequently, Acts have been passed in all provinces governing aspects of municipal incorporation, powers and duties. Constitutional provision that jurisdiction over municipal affairs would rest with the provinces has resulted, quite naturally, in

* Prepared in the Public Finance and Transportation Division, Dominion Bureau of Statistics.

dissimilarity in the organization of local government across the country. This stems not only from the difference in beginnings and subsequent independent growth in each province, but also from variations in requirements arising out of geographical and population differences.

The situation remains in a state of flux, with constant amendment of provincial Acts and charters in an attempt to solve old problems and to meet new ones. Just as the call for new and additional services has enlarged the scope of federal and provincial activities, the municipalities have had to assume responsibilities unheard of a few decades ago, or considered beyond their sphere of activity. As a result, amendments to Acts have varied from those enlarging the powers and the boundaries of municipalities, to those establishing closer provincial control and greater financial aid.

An outline of municipal organization at the end of 1951 in each of the provinces of Canada is given in the following paragraphs.*

Newfoundland.—Newfoundland has only one city, St. John's. The remainder of the population is mostly dispersed in small settlements along the coast, and only since 1937 have a few of the larger of these been set up individually with local councils as towns or, where two or three are close together, as rural districts (30 in 1951). These latter are not rural municipalities but merely towns consisting of two or more settlements. Local affairs in the remainder of the Province are administered by the Provincial Government. In 1949 the Local Government Act was passed to facilitate incorporations.

Prince Edward Island.—The City of Charlottetown and seven towns, all incorporated by special Acts, comprise the total municipal organization in Prince Edward Island. They include less than one-half of one percent of its total area and only one-quarter of its population. The remainder of the population is not organized municipally, as the three counties are purely provincial administrative units.

Nova Scotia.—Municipal organization in Nova Scotia covers the whole of the Province. Halifax and Sydney are the only cities and they operate under special charters, the latter also governed by some special legislation. Towns, which number 40, operate under the Town Incorporation Act. There are no municipalities incorporated as villages. Cities and towns are independent of counties. The rural area is divided into 18 counties which, in themselves, do not represent units of local government. However, 12 of these counties each comprise one municipality, and the other six, two municipalities each, making a total of 24 rural municipalities.

New Brunswick.—The Province is divided into 15 counties which are incorporated municipalities and have direct powers of local self-government in the rural areas. In effect, therefore, they are rural municipalities. In most cases certain of their powers apply in both rural and urban municipalities. The three cities of Saint John, Fredericton and Moncton have special charters, and the 19 towns operate under the Towns Incorporation Act. There are also four villages and 37 local improvement districts.

Quebec.—Municipal divisions in Quebec embrace the more thickly settled areas comprising about one-third of the Province, the remainder being governed by the Province as 'territories'. The organized area is divided into 76 county municipi-

* Municipalities are summarized by type of organization on p. 80.

palities, which are divided again into local municipalities under the Municipal Code and designated as village, township or parish municipalities or simply as municipalities. The counties, as such, have no direct powers of taxation. Funds to finance the services falling within their jurisdiction are provided by the municipalities forming part thereof. Parts of some counties are not yet organized into incorporated units of local government, being in outlying districts with little or no population. There are 331 villages and 1,109 townships and parishes. A small number of these are independent of the counties in which they are located. Of the 34 cities, a few have special charters. The remainder, along with the 132 towns, are governed by the Cities and Towns Act and numerous special Acts.

Ontario.—Slightly more than one-tenth of the area of Ontario is municipally organized, the remainder being governed entirely by the Provincial Government. The older section of the Province is divided into 43 counties, five of which are united with others for administrative purposes. Although incorporated municipalities, each county is comprised of the towns, villages and townships situated within its borders, which provide its revenues. There are 29 cities, 149 towns, 155 villages, 572 townships and 16 improvement districts. Some of each are located in the northern districts of the Province, which are not organized into counties.

Manitoba.—Only the southern and settled section of Manitoba, comprising less than one-eighth of the area, is organized for local self-government. As in the other three western provinces, there is no county organization and all municipalities are independent, except of provincial control. There are four cities, three with special charters and one governed by a number of special Acts. General Acts govern the 33 towns, 37 villages, 109 rural municipalities and five suburban municipalities. An Act of 1944 (amended January 1945) authorizes organization of local government districts in unorganized or disorganized territory.

Saskatchewan.—All municipalities in Saskatchewan derive their powers from general Acts that are designated with the name of the type of municipality. There are eight cities, 90 towns, 388 villages and 299 rural municipalities. The area so organized consists of most of the southern two-fifths of the Province. The remainder of this portion is administered for local purposes by the Province in unincorporated local improvement districts. The northern three-fifths is sparsely populated and without local government.

Alberta.—In Alberta there are cities, towns, villages, and rural municipalities known as municipal districts. The latter three classes come under general Acts. Until 1951 each of the seven cities had its own charter, but these have been superseded by the City Act of 1951. There are 69 towns, 140 villages and 54 municipal districts, but less than one-fifth of the Province is so organized. There are also some unincorporated improvement districts administered by the Province in less densely settled areas.

British Columbia.—British Columbia has less than 0.5 p.c. of its area organized into municipalities. Additional small areas have sufficient population to require administration of local activities by the Provincial Government. There are 35 cities, 41 villages and 28 districts. The latter are chiefly rural municipalities, except for those adjacent to the principal cities of Victoria and Vancouver, which are largely urban in character. It should be emphasized, however, that the application

of the name "city" is somewhat different from the commonly accepted meaning in that several of them have populations of less than 1,000 and perhaps one-half or more would not normally be incorporated as cities in any other province.

24.—Municipalities, by Type of Organization and by Provinces, as at Dec. 31, 1951

¹ Includes 26 towns and 4 rural districts.

² Does not include 37 local improvement districts.

³ Includes 16 incorporated local improvement districts.

⁴ Includes 5 units of self-government officially

known as suburban municipalities. Does not include local government districts.

⁵ Does not include

21 local improvement districts.

⁶ Does not include 56 improvement districts.

Section 4.—Federal and Provincial Royal Commissions

Federal Royal Commissions.*—Royal Commissions established in 1951 are reported here, this list being in continuance of those in previous Year Books beginning with the 1940 edition, pp. 1108-1110:—

Royal Commission appointed to inquire into and report upon claims arising out of World War II, constituted by Order in Council of July 31, 1951 (P.C. 3951). Commissioner: The Right Honourable J. L. Ilsley.

Royal Commission appointed to inquire into and report upon the proposed South Saskatchewan River project, constituted by Order in Council of Aug. 24, 1951 (P.C. 4435). Commissioners: Dr. T. H. Hogg, Mr. G. A. Gaherty and Dr. John A. Widtsoe.

Provincial Royal Commissions.—Only those Royal Commissions established in 1951 are reported here, this list being in continuance of those in previous Year Books beginning with the 1948-49 edition, pp. 1222-1223:—

Newfoundland.—Royal Commission appointed to inquire into and report upon the prices paid or offered to fishermen and the returns received by merchants and exporters for fish production in 1950 and as to whether prices paid or offered to fishermen were fair and just in relation to the returns received by merchants and exporters in respect of such fish. Feb. 17, 1951. Commissioner: Bruce Bolton Feather.

British Columbia.—Royal Commission appointed to inquire into the circumstances of the non-admission of Mrs. Donald Ritchie into hospital and the subsequent loss of her unborn child. Also to inquire into the activating motives of persons and publicity surrounding these circumstances. Apr. 19, 1951. Commissioner: The Honourable H. S. Wood.

Royal Commission to inquire into all circumstances surrounding the incarceration at time of arrest and transportation from Victoria to Oakalla Farm of Daniel LeRoy Sanger. Oct. 23, 1951. Commissioner: His Honour Judge Herbert Howard Shandley.

PART III.—ADMINISTRATIVE FUNCTIONS OF THE FEDERAL GOVERNMENT

Section 1.—Departments, Boards, Commissions, etc.

The following paragraphs indicate the functions of the various departments of Government and the Special Boards and Commissions in connection with the work of government.

While it is not possible, owing to the limitations of space in the Year Book, enumerate the details of each service or the divisions or sections of all the departments, the main branches are given along with those services that differ in some utility from the larger class of subjects handled by a department.

Department of Agriculture.—This Department was established in 1867 (30 Vict., c.53) and conducts the concerns of all phases of agriculture. Research and experimentation are carried out by the Science Service and the Experimental Farms Service; the maintenance of standards and protection of products by the Production Service and Marketing Service; reclamation and development by the Prairie Farm Rehabilitation Administration and the Maritime Marshland Rehabilitation Administration; while security and price stability policies are administered under the Prairie Farm Assistance Administration and the Agricultural Prices Support Board. The results of work in these various fields and information on the policies of the Department in general are made available to the public through the Information Service. For further details and statistics, see Chapter X.

The Canadian Broadcasting Corporation.—The Canadian Broadcasting Act, 1936, provides that there shall be a Corporation, to be known as the Canadian Broadcasting Corporation, which shall consist of a Board of nine Governors appointed by the Governor in Council and chosen to give representation to the principal geographical divisions of Canada. The Board of Governors determines CBC policy, and the Chairman of the Board is required to devote the whole of his time to the performance of his duties under the Act.

The General Manager is the Chief Executive of the Corporation and directs the operations and activities of the Corporation as well as the application of CBC policy as determined by the Board of Governors. Under the General Manager the organization of the CBC consists of the following principal divisions: Program, International Service, Engineering, Commercial, Press and Information, Broadcast Regulations, Station Relations, Personnel and Administration, and Treasury. Regional Representatives are appointed for Newfoundland, the Maritimes, the Prairies and British Columbia.

The Corporation reports to a Minister of the Crown (at present the Minister of National Revenue) who is responsible for dealing with CBC operations when under consideration in Parliament. For further details, see Chapters VIII and XIX.

The Department of Citizenship and Immigration.—This Department came into existence on Jan. 18, 1950, under the Minister of Citizenship and Immigration. It comprises the Immigration Branch, the Indian Affairs Branch, the Canadian Citizenship Branch and the Canadian Citizenship Registration Branch.

The Canadian Citizenship Branch works closely with provincial departments of education, national organizations and societies in the co-ordination of citizenship training programs and in preparation and distribution of material on Canadian subjects to the foreign-language press in Canada.

The Registration Branch administers the Canadian Citizenship Act.

The Immigration Branch encourages immigration and has established a Settlement Service and Field and Inspection Services overseas to screen immigrants before arrival in Canada. The Department has boards of inquiry in Atlantic and Pacific districts for deportation of undesirables, also Field and Inspection Services for examination of ships' crews.

The activities of the Indian Affairs Branch include management of Indian land and reserves, trust funds, welfare projects, relief, family allowances, education, descent of property, rehabilitation of Indian veterans on reserves, Indian treaty obligations, enfranchisement of Indians, and other Indian affairs. Its organization consists of a headquarters office at Ottawa, a regional supervisory staff, and 91 local agencies in the field, each agency being responsible for one or more reserves and bands.

The National Gallery of Canada is also under the jurisdiction of the Minister of Citizenship and Immigration. It was transferred from the administration of the Minister of Public Works in September 1951, and will work toward the building of Canadian citizenship through the encouragement of cultural activities among young persons and immigrants. *See also Chapter IV.*

The Civil Service Commission.—The Civil Service Commission of Canada dates from the Civil Service Act of 1908. Under this Act the Commission was given the responsibility of applying, as far as possible, the principle of appointment by merit in filling permanent positions within departmental headquarters positions at Ottawa, termed the "inside service".

The Civil Service Act of 1918 extended the competitive system of appointments to cover the "outside" as well as the "inside" service and temporary as well as permanent appointments. It made the Commission responsible for establishing a system of organization and classification that would secure uniformity in the staffing of the various departments and in the salaries paid for work of equal levels of difficulty and responsibility.

The jurisdiction of the Commission now extends to all departments of the Government and to a large number of boards and commissions, exclusive, however, of Crown corporations or such agencies as the Bank of Canada, the National Film Board, the National Harbours Board and the National Research Council. *See Part IV of this Chapter, pp. 93-101, for further details and statistics.*

The Civil Service Commission consists of three members, one of whom serves as Chairman. Each member of the Commission is appointed by the Governor in Council for a term of 10 years, and each has the rank and standing of a deputy head. The Commission has a staff of approximately 530 persons working under its direction and located in the headquarters office at Ottawa and in district offices at St. John's, Nfld., Halifax, N.S., Saint John, N.B., Montreal, Que., Toronto, Ont., Winnipeg, Man., Regina, Sask., Edmonton, Alta., and Vancouver, B.C.

The Department of Defence Production.—The Department of Defence Production was formed on Apr. 1, 1951, under the provisions of the Defence Production Act, 1951, which gave the Department a statutory life of five years. Under the Defence Production Act the powers, duties and functions that were vested in the Minister of Trade and Commerce pursuant to the Department of Munitions and Supply Act, 1939, and the Defence Supplies Act, 1950, were transferred to the Minister of Defence Production. The Defence Production Act repealed the Essential Materials (Defence) Act, 1950-51.

Briefly, its task is to co-ordinate the effort required of the Canadian economy in producing armaments necessary to implement the terms of the North Atlantic Treaty and to co-ordinate the production and purchasing of the requirements of the Armed Forces. The three main branches are the Production Branch, the Materials Branch and the General Purchasing Branch. Supporting them are various administrative and service units such as the Economics and Statistics, Legal, Administration, and Comptrollers' Branches, Financial Adviser, etc.

The Defence Production Act, Sect. 9, transfers the duties previously performed by the Minister of Trade and Commerce, in relation to the following Crown companies, to the Minister of Defence Production: Canadian Arsenals Limited, Crown Assets Disposal Corporation, Defence Construction (1951) Limited, Polymer Corporation Limited, Eldorado Mining and Refining (1944) Limited, Northern Transportation Company (1947), and Canadian Commercial Corporation.

The Dominion Bureau of Statistics.—The Dominion Bureau of Statistics was set up by statute in 1918 as a central statistical department for Canada (8-9 Geo. V, c. 43). In 1948, this statute, which had been consolidated as the Statistics Act (R.S.C. 1927, c. 190), was repealed and replaced by the Statistics Act (11-12 Geo. VI, c. 45).

The policy of the Dominion Bureau of Statistics is to compile, analyze and publish statistical information relative to the commercial, industrial, financial, social and general condition of the people and to conduct a census of population and agriculture of Canada at ten-year intervals. The Bureau reports to Parliament through the Minister of Trade and Commerce.

Further details of the work of the Dominion Bureau of Statistics are given in Chapter XXVIII.

The Department of External Affairs.—The main function of this Department is the protection and advancement of Canadian interests abroad.

The Department is headed by the Secretary of State for External Affairs. At the head of the staff is the Under-Secretary of State for External Affairs, with a Deputy Under-Secretary and three Assistant Under-Secretaries. They are assisted by Foreign Service Officers, formally designated Counsellors and First, Second and Third Secretaries.

The work of the Department at Ottawa is carried on through 13 divisions. The three geographical divisions are the Commonwealth, the European and the American and Far Eastern. The seven functional Divisions are: Consular, Defence Liaison, Economic, Information, Legal, Protocol, and United Nations. The three "housekeeping" divisions are Establishments and Organization, Finance, and Personnel. There are two related special sections, Supplies and Properties, and International Conferences. The archives and departmental library are incorporated in a Historical Research and Reports Section and a Press Office arranges press conferences and issues press releases.

The Federal District Commission.—This Commission had its genesis in the Ottawa Improvement Commission, established by Parliament in 1899 to improve and beautify the National Capital by the development and construction of parks and driveways and to co-operate with the City of Ottawa in local improvement and conservation. Its membership is honorary in character and appointed by the Governor in Council, and it reports to the Prime Minister. In 1927 the organization's name was changed to the Federal District Commission, its scope of operations widened to include adjacent areas, and its membership increased to ten. Under the F.D.C. Act the mayors of Ottawa and Hull are included in its membership.

The Commission maintains the grounds of all federal buildings in the National Capital area and landscapes the grounds of new government buildings. In the Ottawa-Hull area (exclusive of Gatineau Park) where it administers 1,878 acres, it has developed 18 parks and 22 miles of scenic driveways.

In 1946 the Commission became the federal agency responsible for carrying out the National Capital Plan. The membership was further increased to permit the appointment of a commissioner resident in each of the provinces and a separate honorary committee was established by the Commission to advise on the development of Gatineau Park. The National Capital Fund, to which Parliament has made annual grants of \$2,500,000 since its inception in 1948, was made available to the Commission to execute the work of the National Capital Plan, and a National Capital Planning Committee was appointed to act as a permanent honorary advisory body to the Commission on the implementation of the Plan. See Chapter I, pp. 31-33, for a brief account of the Commission's work on the National Capital Plan.

The Department of Finance.—The Department of Finance, created in June 1868, is under the authority of the Minister of Finance. The Department is responsible for the financial administration of Canada. It is responsible for the raising of the money required for the various governmental activities by way of taxation or borrowing. The Comptroller of the Treasury, an officer of the Department, is responsible for all Government disbursements.

The Department has an International Economic Relations Division, an Economic Policy Division, Superannuation Branch, Farm Improvement Loans Division, Consumer Credit Division and a Municipal Grants Division. The Royal Canadian Mint is a branch of the Department. The Inspector General of Banks is an officer of the Department.

The Tariff Board and the Canadian Farm Loan Board are responsible to the Minister of Finance.

The Department of Fisheries.—The Department of Fisheries was first organized under a Minister of Fisheries in 1930. Prior to that the federal fisheries services were maintained by the former Department of Marine and Fisheries, established in 1868. The provinces, under various arrangements, have certain administrative responsibilities in the fisheries but the legislative authority for the regulations of coastal and fresh-water fisheries are now with the Federal Department of Fisheries.

The work of the Department includes: conservation and development of the fisheries through the enforcement of fishing regulations, the operation of fish-culture establishments, management and improvement of spawning streams and control of predators; inspection of fish products for quality control and the encouragement of industrial development; promotion of the greatest utilization of fishery products and a proper public understanding of the resource and the industry.

Agencies connected with the Department are the Fisheries Prices Support Board and the Fisheries Research Board of Canada. The Department is also represented on the International Pacific Salmon Fisheries Commission, the International Fisheries (Halibut) Commission and the International Northwest Atlantic Fisheries Commission.

For further details and statistics of the fisheries, see Chapter XIV.

The Department of Insurance.—The Minister of Finance is responsible for the Department of Insurance which originated in 1875. Under the Superintendent of Insurance, the Department administers the statutes of Canada applicable to: insurance, trust and loan companies incorporated by the Parliament of Canada; provincially incorporated insurance companies registered with the Department; British and foreign insurance companies operating in Canada; small loans companies and money-lenders; and Civil Service insurance.

Under the relevant provincial statutes the Department's examiners examine provincial trust companies in the Provinces of Manitoba and New Brunswick and loan and trust companies in the Province of Nova Scotia.

A Fire Prevention Branch was organized in 1919 with responsibility for the administration of Sect. 515 of the Criminal Code. It maintains fire-loss records, makes inspections, reports on fire-prevention legislation and protection methods and endeavours to extend and co-ordinate fire-prevention work in Canada. See also Chapter XXVI.

The Department of Justice.—This Department provides legal services to the Government and the various Government departments, including preparing and settling government legislation, settling instruments issued under the Great Seal, regulating and conducting litigation for or against the Crown, superintending the acquisition of property and prosecutions under federal legislation other than the Criminal Code, administers federal statutes dealing with legal matters and provides administration services for the Supreme Court of Canada and the Exchequer Court.

The Department also superintends the penitentiaries and administers the prison system of Canada.

The Department of Labour.—The Department of Labour was established in 1900 by Act of Parliament (63-64 Vict., c. 24). The Department administers, under the Minister of Labour, legislation dealing with: industrial relations, investigation of disputes, etc.; the regulation of fair wages and hours of labour; government annuities; government employee compensation; merchant seamen compensation; vocational training; publication of the *Labour Gazette*, as well as bulletins of information on industrial and related subjects.

The Unemployment Insurance Commission and National Employment Service is also under the direction of the Minister of Labour. The Canada Labour Relations Board and the National Advisory Committee on Manpower also act on behalf of the Minister of Labour. The Department is also the official liaison agency between the Canadian Government and the International Labour Organization.

Further details and statistics of the Department of Labour will be found in Chapter XVIII.

The Department of Mines and Technical Surveys.—This Department was created by an Act of Parliament (13 Geo. VI, c. 17) which received Royal Assent on Dec. 10, 1949. Its establishment resulted from the reorganization of certain former departments into an integrated organization whose primary function is to provide technological assistance in the development of Canada's mineral resources through investigations, studies and research in the fields of geology, mineral dressing and metallurgy, and topographic, geodetic and other surveys. The Department is under the Minister of Mines and Technical Surveys and is divided into five branches, namely: the Surveys and Mapping Branch, the Geological Survey of Canada, the Mines Branch, the Dominion Observatories and the Geographical Branch.

The Department also administers the Explosives Act which regulates manufacture, testing, sale, storage and importation of explosives, and the Emergency Gold Mining Assistance Act which provides cost-aid to the gold industry.

Boards and Commissions are: Canadian Board on Geographical Names; Dominion Coal Board; Board of Examiners for Dominion Land Surveyors; International Boundary Commission.

For further details and statistics see Chapter XII.

The Department of National Defence.—Created on Jan. 1, 1923, by the National Defence Act, 1922, the Department of National Defence was originally an amalgamation of the Department of Militia and Defence, the Naval Service and the Air Board.

In 1940, the Department of National Defence was separated into three departments, one for each of the Armed Services, and continued under this organization until the cessation of hostilities. In order to afford the maximum possible degree of co-ordination, the three Services were again brought into one departmental organization in 1946.

In 1947, the Defence Research Board was formed to carry out research projects for defence. It is responsible to the Minister of National Defence for this function and for advising him on the effect of scientific, technical and other research on national defence.

For further details and statistics see Chapter XXVII.

The National Film Board.—The National Film Act, 1950, provides for a Board of Governors of nine members—a Government Film Commissioner, appointed by the Governor in Council, who is Chairman of the Board, three members from the public service of Canada and five members from outside the public service. The Board reports to Parliament through a designated Minister of the Crown (at present the Minister of Resources and Development). The Board is responsible for advising the Governor in Council on film activities and is authorized to produce and distribute films in the national interest and, in particular, films "designed to interpret Canada to Canadians and to other nations".

For further details see Chapters VIII and XXVIII.

The National Gallery.—The National Gallery was founded in 1880. By Act of Parliament (3-4 Geo. V, c. 33) it was placed under the management of a Board of Trustees appointed by the Governor General in Council, and is responsible to Parliament through a Minister of the Crown (at present the Minister of Citizenship and Immigration). The first charge of the National Gallery is the development and care of national art collections.

Other important services are the arrangement of loans and exhibitions from abroad and from its own holdings for showing in Canada and abroad, the promotion of good industrial design, and general extension work consisting of the distribution of reproductions for educational purposes, lectures, educational tours, publications, school broadcasts and art films. See also Chapter VIII.

Department of National Health and Welfare.—The Department of National Health and Welfare was established in October 1944. Under the Minister of National Health and Welfare, the Department, which is composed of three branches (Health, Welfare and Administration), is administered through the Deputy Ministers of National Health and National Welfare.

The Health Branch is divided into four directorates—Health Services, Health Insurance Studies, Food and Drugs, and Indian Health Services. The Welfare Branch is made up of the Directorate of Family Allowances and Old Age Security, the Old Age Pensions Division and the Physical Fitness Division. The Department is also responsible for federal civil defence planning, with the Civil Defence Co-ordinator reporting to both Deputy Ministers. The Administration Branch includes divisions where activities cover both health and welfare fields such as research, information, legal and library services as well as administrative, personnel and purchasing and supply services.

For further details and statistics, see Chapter VI.

The Department of National Revenue.—From Confederation until May 1918, Customs and Inland Revenue Acts were administered by separate departments, and after that date were amalgamated under one Minister as the Department of Customs and Inland Revenue. In 1921 the name was changed to the Department of Customs and Excise. In April 1924, collection of income taxes was placed under the Minister of National Revenue and under the Department of National Revenue Act, 1927, the Department became known as the Department of National Revenue.

Besides the assessment and collection of customs and excise duty, taxes and revenues and other services by ports and outports, the Department is responsible for income taxes and succession duties.

The Minister of National Revenue is responsible to Parliament for the Income Tax Appeal Board and the Canadian Broadcasting Corporation.

The National Museum of Canada.—The National Museum illustrates the natural history of Canada—its geology, biology and anthropology. It was formerly part of the Geological Survey which was founded in 1842 but was separated in 1920, and is now part of the Department of Resources and Development. The Museum carries out field investigations in botany, zoology, vertebrate palaeontology, archaeology and ethnology including studies of folk-lore and folk-songs, publishes the results of its research and carries out an extensive educational program. See also Chapter VIII.

The National Research Council.—In 1924 the Research Council Act was passed and, in 1923, laboratories for scientific research were established at Ottawa. The National Research Council now has laboratories for divisions of chemistry, building research, mechanical engineering, radio and electrical engineering, physics, applied biology and medical research, and also has workshop services. Until April 1952, the Council operated the atomic energy project at Chalk River, and its President was head of the Atomic Energy Control Board.

Processes and improvements developed by the Council are made available under licence to industry through a Crown company, Canadian Patents and Development, Limited, and any profits derived from the licensing arrangements are used for further research and development.

The Minister of Trade and Commerce, as Chairman of the Privy Council Committee on Scientific and Industrial Research, is responsible to Parliament for the National Research Council. See also Chapter VIII.

Post Office Department.—Operations of the Post Office Department under a Postmaster General include: air, land, steamboat and railway mail services; international and domestic mail; postage stamps, money orders and parcel post business. The Post Office also is responsible for the Post Office Savings Bank.

For statistics see Chapter XIX.

Department of Public Printing and Stationery.—This Department was established in 1886 and is in charge of the Queen's Printer and Controller of Stationery.

The Department is responsible for supplying all requirements of printing and stationery to and the audit of all accounts for advertising of Parliament and Departments of the Canadian Government; the free distribution and sale of all public documents or papers to the public; the publication of the Statutes of Canada, the *Canada Gazette*, and all departmental reports, papers, etc., required to be published by authority of the Governor General in Council.

The Department of Public Printing and Stationery is under the jurisdiction of the Secretary of State.

Public Archives.—The Public Archives was founded in 1872 and is administered by the Secretary of State. Its purpose is to assemble and make available to the public a comprehensive collection of historical source material relating to the history of Canada. Major emphasis is placed upon official records of the Government, and the personal papers of political leaders and other prominent figures. These are supplemented by copies of many records in the British and French archives that relate to Canada, a fine map collection, an historical library, and many prints, paintings and photographs.

Department of Public Works.—This Department was constituted in 1867 and is responsible for the management, charge and direction of the public works of Canada and, except as specifically provided in other Acts, attends to the construction and maintenance of public buildings, wharves, piers, roads and bridges and the undertaking of dredging. The Department maintains architectural and engineering staffs in each province in addition to the Administrative, Architectural, Engineering and Purchasing and Stores Branches at Ottawa.

Department of Resources and Development.—The Department of Resources and Development was established in January 1950, and comprises sections of the former Departments of Mines and Resources and Reconstruction and Supply. The Department is divided into five branches besides Administration Services: the National Parks Branch administers the National Parks of Canada, historic sites and federal interests in the conservation and protection of wildlife (see also Chapter I, pp. 23-36) and has charge of the National Museum of Canada (see Chapter VIII); the Engineering and Water Resources Branch has charge of federal interests in the trans-Canada highway, construction works for all other branches, the measure and record of stream flow, and the investigation of water-power resources; the Northern Administration and Lands Branch deals with business from the local government of the Northwest Territories and of Yukon Territory and administers lands, timber, minerals and other resources of the Territories; the Forestry Branch conducts investigations in the protection and utilization of the forest resources of Canada, maintains forest experiment stations and forest products laboratories and administers federal assistance to the provinces under the Canada Forestry Act (see also Chapter XI); the Canadian Government Travel Bureau promotes the tourist industry by encouraging tourist travel from abroad and interprovincial travel in Canada.

The Minister of Resources and Development is also responsible to Parliament for the National Film Board, the Central Mortgage and Housing Corporation (see Chapter XVII), the Eastern Rockies Forest Conservation Board, the Northwest Territories Power Commission, the National Battlefields Commission, the Historic Sites and Monuments Board, and the Advisory Board on Wildlife Protection.

Department of the Secretary of State.—The Department of the Secretary of State was constituted in its present form in 1873. The Secretary of State is the official spokesman of the Federal Government as well as the medium of communication between the Federal and Provincial Governments, all correspondence between the Governments being conducted through this Department with the Lieutenant-Governors. He is the custodian of the Great Seal of Canada and the Privy Seal of the Governor General as well as being the channel through which the general public may approach the Crown.

The Secretary of State is the Registrar General of Canada, registering all proclamations, commissions, licences, warrants, writs and other instruments issued under the Great Seal and certain instruments issued under the Privy Seal. He is responsible for the collection and tabling of parliamentary returns.

The Acts administered wholly or in part by this Department will be found at p. 91. The Secretary of State also deals with the organization and administration of the Office of the Custodian of Enemy Property. The Civil Service Commission (see p. 82), the Depart-

ment of Public Printing and Stationery (see p. 86), the Public Archives (see p. 86), and the Chief Electoral Office are under the jurisdiction of the Secretary of State, but the Chairman of the Civil Service Commission, the Queen's Printer, the Public Archivist and the Chief Electoral Officer each have the rank of a Deputy Minister.

The Department of the Secretary of State deals with correspondence concerning the Copyright Appeal Board, the Awards Co-ordination Committee, the Public Records Committee and the Inter-departmental Committee on the use of Parliament Hill.

Department of Trade and Commerce.—The Department of Trade and Commerce although authorized by Act of Parliament on June 23, 1887, did not come into operation until Dec. 5, 1892, by Order in Council. Prior to its creation assistance in the development of foreign trade was provided through the appointment of five Canadian Commercial Agents, serving on a part-time basis and responsible to the Minister of Finance. On Jan. 1, 1895, a Canadian Commercial Agent was appointed at Sydney, Australia, on a salary basis, and therefore became the first Canadian Government Trade Commissioner, in the present meaning of the term.

The Canadian Commercial Agency Service was renamed the Canadian Trade Commissioner Service in 1907. Fifty-one offices were maintained in 41 countries at the beginning of 1952, the majority of which were operated jointly by the Departments of Trade and Commerce and of External Affairs. In such instances, trade commissioners are given diplomatic status and are known as Commercial Counsellors or Commercial Secretaries.

The Department of Trade and Commerce was expanded in 1945 to provide a wide range of additional services to Canadian businessmen, and now comprises the following branches and divisions: Canadian Trade Commissioner Service; Commodities Branch, consisting of an Export Division, Import Division, Export and Import Permit Division and a Transportation and Communications Division; Agricultural Commodities Branch; Standards Branch; Capital Cost Allowance Division; Economics Division; Industrial Development Division; Information Division; International Trade Relations Division; Wheat and Grain Division; and the International Economic and Technical Co-operation Division; Canadian Government Exhibition Commission. The functions of these branches and divisions are set forth in Chapter XXI.

The following boards, bureaus, commissions and corporations are also responsible to the Minister of Trade and Commerce: National Research Council; Board of Grain Commissioners; Canadian Wheat Board; Dominion Bureau of Statistics; Export Credits Insurance Corporation; Trans-Canada Air Lines. Consult the Index for reference to these agencies.

The Department of Transport.—The Department of Transport was created on Nov. 2, 1936, from the former Departments of Marine, Railways and Canals and the Civil Aviation Branch of National Defence.

The work of the Department consists of four main services: marine, air, canals and railways. The work of the Marine Service includes aids to navigation, nautical services, marine agencies, steamship inspection and floating equipment and direct supervision over 300 public harbours; seven other harbours come under supervision of the Department but are administered by Commissions. Air Services cover the operation of civil aviation, meteorological and telecommunication divisions. The latter includes the administration and regulation of radio marine and radio aeronautical aids to navigation and communication by wire and by the Government telegraph and telephone. Canal Services has jurisdiction over the canals and canalized waterways of Canada. These include the main or primary canals on the St. Lawrence River and Great Lakes and a number of subsidiary or secondary canals.

Other services of the Department are in connection with the Government-owned companies: the Canadian National Railways, Hudson Bay Railway, Canadian Government Railway, Canadian National (West Indies) Steamship Service, the Prince Edward Island Ferry and Terminals, Trans-Canada Air Lines, and the Trans-Canada (Atlantic) Air Lines. See also Chapter XIX.

The Minister of Transport is responsible to Parliament for the following boards and commissions: the Air Transport Board; Board of Transport Commissioners; Canadian Maritime Commission; Steamship Inspection Board; and the National Harbours Board. The Minister is also responsible to Parliament for the Canadian Overseas Telecommunication Corporation, a Crown company created by Act of Parliament to operate all external telecommunication assets in Canada. For reference to these boards and commissions consult the Index.

Department of Veterans Affairs.—This Department, established in 1944, is concerned exclusively with the welfare of veterans and includes medical, dental and welfare services, land settlement and prosthetic services and insurance. The Veterans' Bureau assists veterans in the preparation and presentation of pension claims.

The Minister of Veterans Affairs is also responsible for the Canadian Pension Commission and the War Veterans' Allowance Board. The Department has administrative offices in all the larger cities. See also Chapter VI.

Section 2.—Acts Administered by Federal Departments*

List of the Principal Acts of Parliament Administered by Departments of the Government of Canada

NOTE.—Two sessions of Parliament were held in each of the years 1939, 1949, 1950 and 1951. The Acts passed at the first session are indicated by (*) and those at the second session by (†). Copies of individual Acts of Parliament and amendments may be obtained from the Queen's Printer, Ottawa, at prices of from 10 cents to \$1.50 per copy according to number of pages. Where duplications of certain Acts appear in the list parts of these Acts are administered under the Departments given.

Department, Year and Chapter		Name of Act	Department, Year and Chapter		Name of Act
Agriculture— R.S.C. 1927	4	Department of Agriculture.	External Affairs— R.S.C. 1927	65	Department of External Affairs as amended.

¹ The Canadian Broadcasting Act, 1936, c. 24, as amended, is administered by the Minister of Transport but the CBC is not a unit of that Department.

² The Pension Act and the Civilian War Pensions and Allowances Act are administered by the Canadian Pension Commission and the War Veterans' Allowance Act by the War Veterans' Allowance Board.

PART IV.—THE CIVIL SERVICE OF CANADA*

The Federal Civil Service comprises, in the widest sense, all servants of the Crown—other than those holding political or judicial office—who are employed in a civil capacity and whose remuneration is paid wholly and directly from moneys voted by Parliament. Collectively, they form the staffs of the various departments, commissions, boards, bureaus and other agencies of the Federal Government. Nearly every category of occupation is represented in the Civil Service. A few civil servants are appointed by either or both Houses of Parliament directly, a number by departments and other agencies in accordance with the provisions of certain statutes, generally with executive approval of the Governor in Council, and the remainder—by far the majority—are selected and appointed by the Civil Service Commission of Canada.

The Civil Service Commission, as the central personnel agency of the Federal Government, is the custodian of the “merit principle” in respect of both initial appointments and promotions. The steps by which the Commission, in its present form, came to be constituted is the record of Civil Service reform in Canada which began a year after Confederation and culminated in the passing of the Civil Service Act of 1918.

Recruitment.—The recruitment of civil servants is conducted by means of open competitive examination through which every citizen has the right to compete for positions in the service of his country.

Examinations are held periodically as the staff requirements of the public service dictate. Any Canadian citizen may apply for headquarters positions open at Ottawa, but applicants for local positions must be residents of the locality in which the vacancy occurs. Competitive examinations are announced through the press and through posters displayed on the public notice boards of post offices, offices of the National Employment Service, offices of the Civil Service Commission, public libraries and elsewhere. The examinations may be written, oral, a demonstration of skill, or any combination of these.

The names of persons successful in Civil Service examinations, arranged in order of rank, are recorded on eligible lists. Examination results are formally announced by publication in the *Canada Gazette* and each candidate—successful or unsuccessful—is advised of his standing. As required, appointments are made from the eligible lists, which usually remain valid for one year.

Statutory preference applicable to veterans of World War I and World War II has been extended to persons who have served in the Korean theatre of operations. Since 1918, upwards of 100,000 veterans have been appointed to the public service, of whom approximately 65,000 have been appointed within the past seven years. The 100,000 figure includes 10,000 disabled veterans who were accorded an additional preference in appointment.

In recent years, the Civil Service Commission has decentralized its operations and now has ten district offices and four sub-offices across the country. The Commission is granting an increasing measure of autonomy and responsibility to these offices to permit more efficient service to field agencies. They now conduct certain examinations that qualify for permanent as well as temporary employment.

* Text revised by M. M. Maclean, Secretary of the Civil Service Commission of Canada, and statistics prepared in the Public Finance and Transportation Division, Dominion Bureau of Statistics.

Staff Training.—In 1947 the Commission set up a Staff Training Division to promote and guide a systematic service-wide training scheme. The training scheme, sponsored by the Commission, is a joint venture undertaken in co-operation with Federal Government departments, most of which have parallel training divisions. The Commission's Training Division is primarily a co-ordinating agent. It promotes and organizes activities, trains departmental instructors in the presentation of courses, prepares and, in some cases, gives courses of general application to all departments, publishes booklets and other training aids, assists departments in developing training to meet specialized needs, and acts as a general clearing-house for the exchange of information on training matters.

Promotion.—It is a prime object of the Civil Service Act to create a career service. The result is that promotion, like entrance to the Service, is based on merit and a sound promotion system is developing. The present procedure involves the consideration of three factors: seniority or length of service; efficiency of candidates in their present positions; and fitness for the vacant positions. An automatic rating on seniority is given by the Commission and ratings on efficiency and fitness are provided by the department concerned. Appeal machinery, under Commission jurisdiction, has been set up for those employees who feel that their qualifications have not been properly assessed.

Position Classification and Compensation.—Provision is made in the Civil Service Act for the classifying of positions in the public service. A system of position-classification was instituted in 1919 and positions with like duties and responsibilities were classified alike and remunerated equally. Each position has a title, a set of tasks or duties which are proper to it in the organization in which it occurs and, arising out of these duties, a set of qualifications appropriate for their performance. Positions with duties of similar kind are grouped together under a common title to form a class, and grades within the class reflect the level of responsibility.

The determination of rates of compensation for each class is a continuing responsibility of the Commission and salary and wage surveys are conducted constantly. Position classification is a mainspring in the Commission's primary function of recruitment, involving the fixing of standards of qualification for each class of position. The classification structure has been simplified in the past few years by a substantial reduction in the number of classes of positions.

Organization and Methods.—Under the terms of the Civil Service Act, the Commission is made responsible for investigating and reporting to the Governor in Council on all matters affecting the organization of departments. In this respect the Commission acts as agent for the executive arm of the Government which maintains a constant check on the growth of establishments. In addition to the annual scrutiny of estimates by Parliament, departments are required to submit for approval all projected staff increases before engaging additional personnel.

In recent years there has been an increasing awareness of the extent to which economical administration depends on the adoption of modern management techniques and devices. In 1948 the Commission set up an Organization and Methods Service to study problems of management in collaboration with officials directly responsible for major areas of administration. Briefly, this Service affords practical assistance to departments and other agencies of the Government through the systematic examination of structure, operations, procedures and work methods. Its growing facilities are offered, free of charge, to all departments.

Civil Service Statistics.—Monthly returns of personnel and salaries are made by each department of the Federal Government to the Dominion Bureau of Statistics, according to a plan that ensures comparability between departments and continuity in point of time.

From 1914 to 1920, the number of employees increased very rapidly as a result of the extension of the functions of government and of the imposition of new taxes which necessitated additional officials as collectors. New services, such as the Department of Pensions and National Health and the Soldier Settlement Board, were also created during this period. In January 1920, 47,133 persons were employed; this number was the highest reached prior to January 1940, when employees numbered 49,739.

Between March 1939 and March 1951, there was an increase of 78,474 in the total number of permanent and temporary employees. This increase was mainly accounted for as follows: Department of National Defence, 20.8 p.c.; Department of National Revenue, 9.6 p.c.; Post Office Department, 8.9 p.c.; Comptroller of Treasury, 3.8 p.c.; Department of Transport, 4.6 p.c.; Department of Agriculture, 5.0 p.c.; Public Works Department, 3.9 p.c.; Unemployment Insurance Commission, 8.9 p.c.; and Veterans Affairs, including the Soldier Settlement Board, 15.0 p.c.

In March 1951, the number of permanent employees represented 40.6 p.c. of the total number of civil servants as compared with 69.7 p.c. of the total in March 1939, and 66 p.c. of the total in March 1925.

PART V.—CANADA'S EXTERNAL RELATIONS

Section 1.—Canada's Growth in International Status*

The development of the Department of External Affairs is an excellent illustration of the growth of Canada in external status. It was not until forty years after Confederation that a veteran civil servant, Joseph Pope, then Under-Secretary of State, appeared before the Royal Commission on the Civil Service to testify in support of his memorandum on the urgency and desirability "of establishing a more systematic mode of dealing with what I may term for want of a better phrase, the external affairs of the Dominion". Two years later (1909) Prime Minister Sir Wilfred Laurier sponsored a bill for the creation of the Department of External Affairs which stipulated that its head should "have the conduct of all official communications between the Government of Canada and the Government of any other country in connection with the external affairs of Canada". The term "external affairs" was used in order that the new Department should have responsibility for communications of an intra-imperial as well as of an international character. Initially the Secretary of State was placed in charge of the Department but in 1912 Sir Robert Borden secured legislation to vest the office in the Prime Minister with whom it remained until 1946. In that year it was separated from the Prime Minister's Office and headed by a full-time Secretary of State for External Affairs.

When war came in 1914 the Department was still on a very modest basis with only two officers. The chief reason for this unobtrusiveness was the fact that Canada possessed at that time no effective control of its external relations. Its representation abroad was confined to a High Commissioner in London (since 1880), whose office did not come under the jurisdiction of the new Department until 1921, and a Commissioner-General in France (since 1882), neither of whom possessed diplomatic status. Other Canadians were serving abroad as trade commissioners

* Prepared in the Department of External Affairs by F. H. Soward.

or emigration agents but they represented individual departments and not the Government as a whole. Negotiations on such questions as trade and boundaries were conducted through the medium of the British Foreign Office, although Canadian Ministers and civil servants might, on occasion, take the major part in negotiations, as when the Minister of Labour went to Tokyo in 1907 to discuss the vexed question of Japanese emigration to Canada. It was not until the Imperial Conference of 1911 that Canada and the other Dominions were given a glimpse of the workings of British diplomacy in Europe, when it was made clear by Prime Minister Asquith that authority in that field could not be shared.

The great watershed in Canadian policy was World War I. In France and Flanders, Canadian soldiers bought with their blood the title deeds to Canadian external autonomy. By virtue of their achievements from Ypres to Mons, Prime Minister Sir Robert Borden could claim for Canada at the Imperial Conference of 1917 an "adequate voice in foreign policy" and could secure separate representation from the United Kingdom at the Peace Conference, separate signature of the Peace Treaties, and separate membership in the League of Nations.* In 1926 the Balfour Report formally described the new relationship of the Dominions and of India to the United Kingdom as being that of "autonomous communities . . . equal in status and in no way subordinate one to the other in any respect of their domestic or external affairs . . .". In the meantime Canada had signed (1923) its first international treaty (on the regulation of halibut fishing on the Pacific coast) with the United States without the usual counter-signature of the British Ambassador resident in the country with which the treaty had been negotiated. An office at Geneva had been established in 1925 under Dr. W. R. Riddell for the conduct of Canadian affairs with the League of Nations. Both the United Kingdom and the United States had agreed to the creation of a separate Canadian Mission at Washington which originally was to have been combined with the British Embassy.

The need for such an office had long been felt because of the number and complexity of questions which inevitably arose in Canadian-American relations. In 1918 a Canadian War Mission was established at Washington and its secretary Merchant Mahoney remained, when the Mission ended, as Agent of the Department of External Affairs but without diplomatic status. Although the right to establish a Canadian Mission had been conceded in 1920, it was not until February 1927 that the first Canadian Minister, the Hon. Vincent Massey, formally presented his credentials to the President of the United States. Shortly afterwards the Hon. William Phillips became the first Minister from the United States to Canada. The new Legation at Washington was entirely separate from the British Embassy.

After July 1, 1927, as a result of the decision of the Imperial Conference of 1926 that in future the Governor General in each Dominion should represent the King alone, correspondence between the Governments of the United Kingdom and Canada was addressed directly to the Secretary of State for External Affairs. To represent the United Kingdom Government at Ottawa, a High Commissioner was appointed in 1928. Sir William Clark was the first to fill that post. No other Commonwealth country established an office in Canada before the outbreak of World War II except South Africa which sent an Accredited Representative, David deWaal Meyer, in 1938.

* It should be noted that Sir Robert and his Canadian colleagues were also members of the British Empire delegation, thus giving Canada double representation at the Conference. It was largely through that delegation that Canada's influence was exercised at Paris.

The first Canadian Legation in Europe was opened at Paris in 1928. This was to be expected since almost 30 p.c. of the Canadian people were descendants of the little group of French settlers who had struggled to build up New France in the Western Hemisphere. The first appointee was the Hon. Philippe Roy who had served at Paris during the previous seventeen years as Commissioner General. The first Canadian diplomatic Legation in Asia was established at Tokyo in 1929 with the Hon. Herbert Marler as the first Minister. Exchange of Missions with Japan was based on the expectation of rapidly increasing trade with the Orient, on the role of Japan as the major power in the Far East, and on the advisability of having a diplomat available in the Japanese capital for discussions, when necessary, of immigration matters.

At the close of the 1920's, Canada was gradually securing recognition abroad of its expanding international status. Election to the League of Nations Council in 1927, the first occasion on which the Assembly had chosen a British Dominion to serve on that body, and an individual invitation from the United States to sign the Pact of Paris in 1928, were indications that the world was beginning to appreciate the implications of the evolution of the British Commonwealth of Nations. At London, it was becoming apparent that the possibility of maintaining a single imperial foreign policy, as had been claimed by Lloyd George in 1921, was disappearing, and the most that could be hoped for was the preservation of a harmony of opinion on major questions of foreign policy. At Ottawa, the Department of External Affairs was slowly expanding its personnel and broadening its influence in government circles under the leadership of Dr. O. D. Skelton, a distinguished scholar who left Queen's University to become Under Secretary of State for External Affairs in 1925.

The depression years of the 1930's were a factor in retarding the expansion of the Department of External Affairs and prevented the creation of more Missions, except in Belgium and the Netherlands which had initiated proposals for an exchange. In 1937 Baron Silvercruijs established Belgium's Legation at Ottawa, but it was not until 1939 that Mr. Jean Désy was accredited as Canada's Minister to both of the Low Countries. During that period, as the shadow of war fell across Asia, Africa and Europe in turn, the Canadian Government made clear at Geneva its rejection of automatic advance commitments to economic or military sanctions against an aggressor, but privately at Berlin (1937) and publicly Prime Minister King declared that "If there was a war of aggression nothing in the world would keep the Canadian people from being at the side of Britain". Similarly, in 1938, President Roosevelt pledged American support if domination of Canadian soil were threatened by an overseas empire and the two countries began to concert their defence arrangements. In 1939, only after Parliamentary approval had been received did the Government of Canada forward to London, for the King's signature, a separate declaration of war upon Germany from that previously made by the United Kingdom. The action of the United States Government in not applying the neutrality legislation to Canada until this step had been taken was a significant recognition of Canada's advance in status.

The war years gave Canada greater stature in international affairs. The substantial contribution which the country was able to make to the Allied cause in both its military and economic aspects and the relative decline in strength of many European countries made it necessary for her to assume new and greater responsibilities. At the close of the War, Canada ranked third among the Allies in naval strength and fourth in air power. Alone among the Allies, Canada had not required Lend-Lease Aid from the United States but had contributed almost

\$2,250,000,000 of Mutual Aid. During and after the War, to further reconstruction, almost \$600,000,000 was advanced as Export Credits to a number of countries and a loan of \$1,250,000,000 was extended to the United Kingdom. In the operations of UNRRA, Canada was the third largest contributor and one of the major sources of supply.* Because of these achievements and the constructive policies of its representatives at the numerous international conferences at the close of the War and thereafter, Canada came to be regarded as a "Middle Power".

The rapid expansion of Canadian representation abroad has reflected these changed conditions. Immediately after war was declared it was decided to send High Commissioners to Australia, New Zealand, South Africa and Ireland. In the post-war period similar arrangements were made with India and Pakistan. Exchanges were made with Canada's allies, initially by accrediting a single Minister, Major-General George P. Vanier, to the Allied Governments established at London and by sending Ministers to the wartime capitals of China and the U.S.S.R. During the War, neutral countries such as Sweden and Turkey also sent Ministers to Ottawa with the understanding that Canada would reciprocate in the post-war period. To emphasize hemispheric solidarity against the Axis powers and with a view to furthering commercial opportunities in Latin America, Missions were opened during the War in Argentina, Brazil, Chile, Cuba, Mexico and Peru. No new Missions have been opened there since the War but a Consulate-General was created in Venezuela. Uruguay has had a Legation at Ottawa since 1947. In 1943 the first Canadian Mission was elevated to the rank of Embassy in the United States and since that time the majority of Canadian Missions abroad have achieved a similar rank. Although for various special reasons Consulates were established during the War in Greenland and St. Pierre and Miquelon and a Consulate-General at New York, it was not until 1947 that a Consular Division was established in the Department. Since that time, in addition to the six consular offices in the United States, the new Division has been concerned with offices in Brazil, China, Germany, the Philippines and Venezuela. At the end of 1951, Canada had Embassies in eighteen countries, Legations in eight countries, High Commissioner's offices in six countries, and Missions of a special character at Tokyo and Berlin, or accredited to the United Nations Organization at New York and Geneva, and to the Organization for European Economic Co-operation at Paris. The Canadian diplomatic representatives in Belgium, Norway and Sweden are also accredited to Luxembourg, Iceland and Finland where, at present, Legations are not maintained. In January 1952, Canada and Portugal agreed to establish diplomatic relations—a step facilitated by their common membership in the North Atlantic Treaty Organization. To staff these offices as well as headquarters at Ottawa, over 250 foreign-service officers, including heads of Missions, are required.

But it is not only diplomats, consuls and trade commissioners who represent Canada abroad in almost fifty countries. The presence of Canadian soldiers, sailors and airmen in Korea, Germany, France and the United Kingdom is proof positive that the Canadian people are prepared to play their part in combating or deterring aggression in Asia or Europe. The despatch of Canadian technical experts to under-developed countries either at the request of the United Nations or in accordance with the Colombo Plan, and the appropriation of funds to further economic recovery overseas are a demonstration of Canadian willingness to help build a happier world with higher living standards.

* Cf. "Canada's Part in the Relief and Rehabilitation of the Occupied Territories". *Canada Year Book 1945*, pp. 79-85.

Section 3.—International Activities *

Subsection 1.—Canada and Commonwealth Relations, 1950-52

Developments in Commonwealth relations from the end of the year 1949 to mid-1952 were unspectacular in comparison with the period immediately preceding, which saw such remarkable events as the acceptance of the Republic of India as a continuing member of the Commonwealth, the withdrawal of the Republic of Ireland from the measure of association with the Commonwealth which it had maintained up to that time, and the union of Newfoundland with Canada. During the period 1950-52 the members of the Commonwealth maintained their existing system of consultation and co-operation and were chiefly concerned with developments in the outside world.

The tense international situation resulting from the attitude taken by the Soviet Union and its satellites and from the behaviour of the communist régime in China during the past three years was one of the principal subjects of discussion, both by correspondence and at formal or informal meetings, among the Commonwealth group of nations. Both the Commonwealth Meeting on Foreign Affairs held at Colombo, Ceylon, in January 1950, and the Meeting of Commonwealth Prime Ministers held at London, England, in January 1951, devoted much time and attention to the above situation and the problems arising from it. In particular, developments in Asia, where the smaller non-communist countries have been exposed to communist infiltration or open invasion, called for the most careful consideration not only by the Commonwealth countries in that area but also by all members of the Commonwealth, whose ideals of freedom and democracy might be endangered by successful aggression.

It was clear that the backward agricultural and industrial condition of many countries of south and southeast Asia, along with the destruction and impoverishment in that area which had resulted from operations during World War II, would, if ignored, undermine any hope that these countries would have a healthy and continuous development along democratic lines. The 1950 Colombo Conference was greatly concerned with this situation and for this reason among others, urged the necessity of assistance to the nations of south and southeast Asia from the more industrially advanced countries in the Commonwealth and elsewhere. The Colombo Plan (see pp. 122-124) which was fashioned at this meeting and in which Canada is participating, is one of the most promising contributions towards building up the free world and enabling it to stand against totalitarianism.

Another subject which engaged the attention of both the 1950 Commonwealth Meeting of Foreign Ministers and the 1951 Commonwealth Meeting of Prime Ministers was the question of peace settlements, particularly with Japan, and the allied question of security in the Pacific area. While the discussions were helpful in smoothing over some differences of opinion on the Japanese settlement, they did not result in all Commonwealth members reaching a common decision in this matter. The Government of India eventually decided to negotiate a separate treaty with Japan, while the other Commonwealth governments, including Canada, joined the United States and other interested countries in signing a Japanese Peace Treaty at San Francisco on Sept. 8, 1951. At the same time the position of the more exposed Commonwealth countries in the Pacific area was safeguarded by the signature of a Security Treaty by the United States, Australia and New Zealand.

* Prepared with the co-operation of the Department of External Affairs, Ottawa.

Developments in China also were among the matters discussed at both Meetings. In regard to recognition of the Chinese communist government, as in all matters of concern to Commonwealth nations, it was understood that each government must take the responsibility of making its own decision. Until mid-1952, the Chinese communist government had been recognized by the three Asian members of the Commonwealth and by the United Kingdom, while the other members of the Commonwealth, including Canada, continued to refrain from recognition.

A new and very serious problem in northeast Asia was created by the invasion of South Korea on June 25, 1950, by North Korean communists. Canada and the other countries of the Commonwealth which were also members of the United Nations supported the action taken by the Security Council to assist South Korean resistance. Most of them, including Canada, contributed armed forces for this purpose. A Commonwealth Division, consisting of United Kingdom, Canadian, Australian and New Zealand combat forces and a medical unit from India, was organized as part of the United Nations forces, and has acquitted itself with distinction. The nations of the Commonwealth, like many other members of the United Nations, have been gravely concerned over the destruction to life and property in Korea, and are contributing to relief and rehabilitation.

The 1951 Meeting of Prime Ministers gave careful attention to the discussions on the Korean problem in particular, and on a Far East settlement in general, which were simultaneously being carried on at the General Assembly of the United Nations at New York, and exchanged views on the means by which their representatives at New York could best assist in these discussions. Close liaison was maintained with the United Nations Assembly.

In a declaration issued at the close of the 1951 Meeting, the Prime Ministers, in addition to urging speedy settlements with Germany and Japan, stated they would welcome any feasible arrangement for a frank exchange of views with Stalin or with Mao Tse-tung, and insisted that they did not seek to interfere in the affairs of the Soviet Union, China or any other country. The Commonwealth countries, it was declared, did not regard themselves as an exclusive body, but welcomed co-operation with other nations. It was recognized, however, that so long as the fear of aggression existed the Commonwealth countries would have to strengthen their defences. Continued support of the United Nations and of the Colombo Plan was affirmed.

Both the 1950 Meeting of Foreign Ministers and the 1951 Meeting of Prime Ministers recognized the influence of economic problems upon the international situation, and gave consideration to these important questions.

One economic problem which was becoming acute in 1951 was the shortage of raw materials, and the consequent maldistribution of manufactured and semi-manufactured goods. The Meeting of Prime Ministers felt that in these circumstances it would be desirable to have closer and more regular consultation among Commonwealth countries on all questions of supply and production. One result of their examination of this problem was the calling of a meeting of Commonwealth Ministers concerned with supply matters, which opened at London on Sept. 24, 1951, and made arrangements to increase the exchange of information both on raw materials and on finished goods, and to facilitate deliveries of manufactured articles to countries of the Commonwealth which might require them.

The deterioration in the United Kingdom's financial situation that took place in the autumn of 1951, and the continuing difficulties of the Sterling Area in general, raised urgent problems for all members of the Commonwealth, not excepting Canada, the only non-sterling member. A meeting of Commonwealth Finance Ministers accordingly took place at London in January 1952, and discussed measures that might be taken to meet the situation. Some of the countries concerned, particularly the United Kingdom and Australia, later took drastic steps to arrest further deterioration in their own position. While some such measures may have been unavoidable in the immediate emergency, discussions on an official level continued with a view to planning for the eventual expansion of trade which appears to be the only satisfactory solution for the whole problem.

International tension, besides adversely affecting the world's economic development during the past three years, also made it necessary to devote to strengthening the defences of Commonwealth countries resources that would normally have been used to increase trade and prosperity. In general, the distribution of the Commonwealth countries through all parts of the world has made it essential to organize their defences on a regional basis providing for full co-operation with friendly foreign countries. As regards North Atlantic defence, for example, Canada and the United Kingdom, as members of the North Atlantic Treaty Organization, have worked together in co-operation with the other members of NATO, while the United Kingdom, the Union of South Africa, and Southern Rhodesia have consulted with other countries interested in the defence of Africa. A Conference of the Defence Ministers of the United Kingdom, Australia, New Zealand, the Union of South Africa and Southern Rhodesia, at which Canada was represented by observers, was held at London in June 1951 to consider defence problems arising in the Middle East and other regions of common concern.

A number of conferences were held to discuss special problems of an economic, scientific or technical character. These included a conference to review the work of the Commonwealth Agricultural Bureaux; meetings on air transport and aeronautical research; gatherings of survey officers, statisticians, auditors-general, and scientists in various special fields; and a British Commonwealth Scientific Conference.

In addition, Canada is represented on such standing bodies as the Executive Council of the Commonwealth Agricultural Bureaux; the Commonwealth Economic Committee; the Commonwealth Shipping Committee; the Commonwealth Telecommunications Board; the Commonwealth Air Transport Council; the Commonwealth Advisory Aeronautical Research Council; the Commonwealth Liaison Committee; the Commonwealth Committee on Mineral Resources and Geology; and the Imperial War Graves Commission.

The Commonwealth Agricultural Bureaux are, for the most part, bodies which collect and distribute information on agricultural research. All of them which are engaged exclusively in this work are located in the United Kingdom. The work of the one in Canada, known as the Commonwealth Bureau of Biological Control, is of a somewhat different nature; it undertakes to control the spread of noxious insects and plants by such means as the collection and distribution of parasites. The work of these Bureaux was reviewed by the Commonwealth Agricultural Bureaux Review Conference, which met at London in June 1950, and made various recommendations for increasing the usefulness of the Bureaux and ensuring co-operation with United Nations organizations and with interested foreign governments. The Canadian Government is represented on the Executive Council of

the Commonwealth Agricultural Bureaux by Dr. H. J. Atkinson and Dr. M. I. Timonin of the Department of Agriculture and Mr. J. G. Robertson of the Office of the High Commissioner for Canada in the United Kingdom.

The Commonwealth Economic Committee issues annual statistics on world production and trade in certain commodities, including dairy produce, meat, fruit and grain crops, and monthly intelligence bulletins on some of these. It has also, from time to time, undertaken special studies on economic questions of interest to Commonwealth governments. The Canadian representative is Mr. F. Hudd of the High Commissioner's Office at London.

The Commonwealth Shipping Committee was established in 1920 for the purpose of making special investigations relating to the co-ordination and improvement of ocean-shipping facilities. It includes representatives of industry as well as of governments. The High Commissioner for Canada in the United Kingdom represents the Canadian Government.

The Commonwealth Telecommunications Board, which operates under the Commonwealth Telegraphs Agreement of 1948, is charged with the duty of making recommendations to Commonwealth governments on joint telecommunications policy, co-ordination of cable and wireless systems, and other telecommunications questions. Canada is represented by Mr. J. H. Tudhope of the High Commissioner's Office at London.

The Commonwealth Air Transport Council is a consultative body for the discussion of civil aviation questions. It issues a quarterly news-letter and holds occasional meetings as required, the latest of which took place at Montreal, Que., in 1950. Mr. J. H. Tudhope is the Canadian member. Canada also participates in an auxiliary regional association, the South Pacific Air Transport Council, which includes the United Kingdom, Australia, New Zealand and Fiji. A meeting of this body was held at Wellington in October, 1951; Canada was represented by the High Commissioner in New Zealand.

The Commonwealth Advisory Aeronautical Research Council is an organization for the promotion of aeronautical research and for discussion and exchange of information on questions of aeronautics. Canadian representatives are Air Vice-Marshal D. M. Smith of the Department of National Defence, and Mr. R. J. Brearley of the High Commissioner's Office, London. A meeting of this body took place at Ottawa, Ont., in September 1950.

The Commonwealth Liaison Committee originated very informally as a means by which United Kingdom government departments could keep the London missions of other Commonwealth countries in touch with developments under the European Recovery Program. Its scope has since been extended to cover other economic matters of mutual interest, in particular the supply and production of raw materials and manufactured goods.

The Commonwealth Committee on Mineral Resources and Geology was set up as a result of a recommendation by the Royal Society Empire Scientific Conference of 1946, which was endorsed by the British Commonwealth Scientific Official Conference of that year, and further developed by the Specialist Conference on Geology and Mineral Resources held in 1948. Its purpose is to promote collaboration and exchange of information on the investigation of geology and mineral resources throughout the Commonwealth. Dr. G. S. Hume of the Department of Mines and Technical Surveys represents the Canadian Government.

The Imperial War Graves Commission was founded in 1917 for the purpose of permanently commemorating those members of His Majesty's forces who lost their lives in World War I. Its powers were later extended to cover World War II. Its chief duty is the establishment and maintenance of cemeteries and memorials. There is a Canadian Agency of the Commission at Ottawa; Colonel D. C. Unwin-Simson of the Canadian Embassy at Paris is the Canadian representative on the Commission.

Bodies such as these form a useful means of exchanging information and views on special economic, scientific or technical questions and of working out recommendations for the consideration of the governments concerned.

Two controversies between Commonwealth governments, both of which arose before 1950, have continued unsolved: the dispute between India and Pakistan over Kashmir and other matters, and the dispute between India and Pakistan on the one hand and the Union of South Africa on the other respecting the treatment in South Africa of persons of Indian origin. Both disputes are before the United Nations, and the Canadian Government and other Commonwealth governments which are members of the United Nations have continued to endeavour, in co-operation with other members of that body, to bring about some solution. In addition, an opportunity was taken during the Meeting of Prime Ministers in 1951 to have informal talks on the Kashmir question by the Prime Ministers of Pakistan and India along with some of the other Prime Ministers, including the Prime Minister of Canada. While these talks had no decisive effect, they did assist in clarifying the position and suggesting possible lines that might be explored in working towards a settlement.

Despite difficulties and problems, the Commonwealth association has, during the period covered by this survey, continued to serve as one of the most effective means of international discussion and co-operation, based in large measure on common traditions, similar political institutions and common ideals.

Subsection 2.—Canada and the United Nations

The early history of the United Nations and of Canada's part therein is given in the 1946 Year Book, pp. 82-86. Additional material appeared in the 1948-49 edition, pp. 122-125, and in the 1950 edition, pp. 134-139. The following material brings the record of Canada and the United Nations up to Feb. 5, 1952, the date of the adjournment of the Sixth Regular Session of the General Assembly.

In political and security questions, the General Assembly became relatively more important in the United Nations, during the period under review, as effective action in the Security Council was more and more frustrated by the Soviet Union veto. The Interim Committee of the General Assembly did not play the important role that had been anticipated. It met in 1949 and in 1950 without making any major recommendations. It did not meet in 1951, for the procedural reason that the Fifth Session of the Assembly remained technically in session until the day before the convening of the Sixth Session. No new subjects were assigned to the Interim Committee by the Sixth Session of the Assembly.

Canada has continued to take an active part in United Nations deliberations both in the General Assembly and in important subsidiary bodies and, as a member, its contribution has been important in the social, economic and humanitarian activities. Canada completed a two-year term on the Security Council at the end

of 1949 and a term of membership on the Economic and Social Council at the end of 1948; after a year's absence, Canada was elected to a further three-year term on the latter Council commencing Jan. 1, 1950. Canada is a member of all specialized agencies of the United Nations and of the following functional commissions of the Economic and Social Council: the Commission on Narcotic Drugs, the Social Commission, the Fiscal Commission and the Statistical Commission.

Canadian delegations attended all sessions of the General Assembly during the period 1949-51—the second part of the Third Session in April and May 1949, and the Fourth, Fifth and Sixth Regular Sessions in 1949, 1950 and 1951. The Secretary of State for External Affairs acted as chairman of the delegation at each of these Sessions; at the Sixth Session, the Minister of Justice assumed the chairmanship after Jan. 2, 1952.

During the period 1949-51, only two new members were admitted to the United Nations—Israel on May 11, 1949, and the Republic of Indonesia on Sept. 28, 1950. The applications of such states as Ceylon, Ireland, Italy and Portugal were vetoed by the Soviet Union Representative in the Security Council.

The Korean Conflict.—The Soviet Union, which since the previous January had been boycotting the Security Council over the question of Chinese representation, was absent from the Council on June 25, 1950, when North Korean forces attacked across the 38th parallel. With no Soviet veto to frustrate its actions, the Security Council was able to take quick and decisive measures. It convened, on United States initiative, on the day of the attack and adopted a resolution calling for the cessation of hostilities and the withdrawal of North Korean forces to the 38th parallel. When this resolution was ignored by North Korea, other Council resolutions followed quickly, recommending that member states furnish the Republic of Korea with such assistance as might be necessary to repel the armed attack, and setting up a Unified Command. The United States took the initiative throughout the crisis, committing first sea and air forces and then ground forces to the area. An overwhelming majority of the United Nations, including Canada, subsequently approved the Security Council's actions, and a smaller but still substantial number (including Canada) contributed armed forces to the United Nations Command.

Throughout the summer of 1950, United Nations troops fell back before the initial strength of the North Korean attack. However, the tide turned with the Inchon landing of Sept. 15, and the rapid advance of United Nations troops up the peninsula raised new and urgent problems. Meanwhile the Soviet Union had returned to the Security Council on Aug. 1 and had, as expected, prevented further constructive action by that body. This was the situation that faced the Fifth Session of the General Assembly when it convened at New York on Sept. 19, 1950.

On Oct. 7, the Assembly adopted a resolution establishing a seven-member United Nations Commission for the Unification and Rehabilitation of Korea. As plans for the implementation of the resolution were being worked out, however, Chinese communist troops intervened in force in Korea, in the guise of "volunteers". This led to renewed debate in the Security Council and the vetoing by the U.S.S.R. on Nov. 30 of a resolution calling for the withdrawal of Chinese communist troops from Korea. The General Assembly, on Dec. 14, 1950, set up a "Cease-fire Group" to explore the possibilities of a cease-fire, meanwhile refraining from condemning the Chinese communist aggression.

The Cease-fire Group, of which the Canadian Secretary of State for External Affairs was a member, submitted a statement of principles, early in January 1951, to serve as a basis for settlement of the Korean dispute and other Far Eastern problems. These were transmitted to the Chinese communist authorities. The reply of the Communist Chinese Foreign Minister was not regarded as satisfactory and on Feb. 1, 1951, a resolution condemning the Peking Government's aggression was adopted by a large majority of the members of the General Assembly, including Canada.

Military operations continued and it became apparent that a military stalemate might come about, with the United Nations forces in control up to approximately the 38th parallel. Following an indication by the Soviet representative to the United Nations that cease-fire discussions might now be usefully initiated, messages were exchanged between the military commanders in Korea, and representatives of the opposing forces met on July 10, 1951. Cease-fire negotiations continued until Aug. 22. They were renewed on Oct. 25, and agreement was reached Nov. 27, 1951, on the principles which should govern the definition of a cease-fire line, but on other issues, especially the exchange of prisoners of war, the negotiators remained deadlocked. The Sixth Session of the General Assembly, before its adjournment of Feb. 5, 1952, authorized the Secretary-General to convene a special session of the Assembly on the conclusion of an armistice or in the event of other developments in Korea.

The United Nations took early action for the relief of the suffering caused by the Korean conflict and for the reconstruction of the country when circumstances might permit. In the autumn of 1950 the General Assembly, and the Economic and Social Council which was meeting concurrently in special session, established the United Nations Korean Reconstruction Agency (UNKRA). A five-member committee, on which Canada was represented, was set up to advise UNKRA's Agent-General. Canada was among the first and most substantial contributors to UNKRA.

Collective Measures.—On Nov. 3, 1950, the General Assembly adopted a resolution on "Uniting for Peace". This resolution provided that if the Security Council, because of lack of unanimity among the permanent members, failed to act in a situation that endangered peace, the General Assembly, if not in session, might be convened on 24 hours notice (a) by request of the Security Council (on the vote of any seven Council members), or (b) by request of a majority of the members of the United Nations. The Assembly at the same time established a Peace Observation Commission to observe and report in areas of international tension, and a Collective Measures Committee to study and report on the measures, including political, economic and military measures, which the United Nations might use to maintain and strengthen international peace and security, taking account of collective self-defence and regional arrangements. Canada became a member of the Collective Measures Committee.

In January 1952, the General Assembly, taking note of the report of the Collective Measures Committee, directed the Committee to continue its studies for another year. Member states were also asked to include within their armed forces units available for service with the United Nations.

Disarmament.—The deadlock in both the Atomic Energy Commission and the Commission for Conventional Armaments continued to the end of 1951. This deadlock was due to the persistent Soviet demands for an immediate prohibition

of atomic weapons and for a one-third reduction in the armed forces of the Great Powers. Western governments opposed both demands, the first because no proposals for adequate atomic inspection, verification and control had been accepted by the U.S.S.R., and the second because the existing disparity between the armed forces of the communist world and those of the free world made it impossible for the democracies to accept a formula which would perpetuate the present dangerous unbalance.

On Dec. 13, 1950, the Assembly created a committee to study the advisability of merging the Atomic Energy and the Conventional Armaments Commissions. Canada, which had been one of the sponsors of the proposal, was made a member of this committee. In accordance with the recommendations of the committee the Assembly on Jan. 11, 1952, established a Disarmament Commission, under the Security Council, to replace the two previous Commissions. The new Commission, given the same membership as the former Atomic Energy Commission (that is, the eleven members of the Security Council, plus Canada), was directed to prepare proposals for inclusion in a draft treaty or treaties, respecting the regulation, limitation and balanced reduction of all armed forces and armaments, and the effective international control of atomic energy.

Palestine.—During the period 1949-51, the Palestine Conciliation Commission had little success in its efforts to bring about agreement on the differences between Israel and its neighbours. In 1950, the Assembly noted with concern that progress was not being made and the Sixth Session of the Assembly, in January 1952, adopted a resolution asking the Conciliation Commission to continue its work. This resolution was supported by the Canadian delegation, which had succeeded in formulating amendments making it acceptable to both Israel and the Arab states. It was felt that, with both sides concurring, the resolution had some hope of success.

Another important problem which occupied the Assembly in this connection was that of Palestine refugees. In the autumn of 1948, a fund was established under the name of United Nations Relief for Palestine Refugees. At the end of 1949 a more permanent relief agency was established, entitled the United Nations Relief Works Agency for Palestine Refugees in the Near East (UNRWAPR). This Agency was continued by the General Assembly in 1950 and, in January 1952, the Sixth Session endorsed a program envisaging the expenditure of large sums of money for relief and reintegration during a three-year period ending June 30, 1954. Canada has supported United Nations action to assist Palestine refugees and has made substantial contributions to UNRWAPR.

Indonesia.—The year 1949 saw the settlement of the Indonesian problem, despite the fact that an early solution appeared unlikely. In January 1949, the Security Council called for an immediate end of hostilities and the release of political prisoners, and replaced its Committee of Good Offices by a United Nations Commission for Indonesia with broad powers to act as the Council's representative. A Security Council directive of Mar. 23, 1949, sponsored by Canada, resulted in a meeting of representatives of the opposing forces, and substantial agreement was reached by early May. In the following weeks, Netherlands forces were withdrawn from the Indonesian capital, political prisoners were released and a general ceasefire was proclaimed on Aug. 28. A Round Table Conference, including the Netherlands and Indonesian representatives and the United Nations Commission, met at The Hague from Aug. 23 to Nov. 2. As a result of the agreement

reached, full sovereignty was transferred to the Government of the Republic of the United States of Indonesia at the end of December 1949, and the two countries became partners in the Netherlands-Indonesian Union. Indonesia became a member of the United Nations in September 1950, its application being sponsored by the Netherlands.

Berlin.—The Berlin blockade was still on the agenda of the Security Council at the end of 1948, but the subject was not formally discussed in the United Nations in 1949. The blockade was lifted on May 12, 1949, not directly because of United Nations action but as a result of long negotiations between the Western Powers and the U.S.S.R. which, however, began with an informal exchange of views between the United States and Soviet representatives at the United Nations.

Other Political Questions.—Other questions that occupied the United Nations in the period 1949-51 included Greece and the repatriation of Greek children, the dispute between India and Pakistan over Kashmir, the treatment of people of Indian origin in the Union of South Africa, the problem of South-West Africa, various questions regarding trust and non-self-governing territories (chiefly in Africa), the complaint by Yugoslavia of "hostile activities" by the cominform states, the violation of human rights in Bulgaria, Hungary and Roumania, and the disposal of the former Italian colonies. (Libya achieved independence on Dec. 24, 1951, and was immediately recognized by Canada.)

The Economic and Social Council.—The most notable achievement of the Economic and Social Council in 1949 was its elaboration of an expanded United Nations program for technical assistance to under-developed countries, unanimously approved by the General Assembly at its Fourth Session. Canada has contributed generously to the expanded program. The Council was given continuing responsibility for the co-ordination of the related programs of the various specialized agencies. The whole question of helping the economically under-developed countries of the world to help themselves continued to command a large share of the Council's attention in 1950 and 1951. In 1951, the Council considered the possibility of establishing an international development authority to be concerned with the distribution of grants and loans to under-developed countries. The subject came before the Sixth Session of the General Assembly and will be further studied by the Economic and Social Council.

In the social field, methods for furthering international recognition and observance of human rights and fundamental freedoms have occupied a great deal of the time, not only of the Economic and Social Council's Commission on Human Rights, but also of the Council itself and of the General Assembly. There have been two phases to this question. First, the General Assembly adopted, in December 1948, a Declaration of Human Rights, which carries great moral weight but is not an enforceable instrument. In the second place, work has been proceeding on the preparation of a covenant or covenants on human rights which would be legally binding on governments acceding to them. The Fifth Session of the General Assembly in 1950, examining a draft covenant submitted by the Human Rights Commission through the Economic and Social Council, concluded that the covenant should be broadened to contain economic, social and cultural rights, as well as basic political rights. The question of whether these economic, social and cultural rights should be included in the same covenant as traditional civil liberties, or in a second covenant, was considered by the Economic and Social Council at its Thirteenth

Session in 1951. The majority of the Council members, including Canada, decided that two fundamentally different types of "rights" were involved, requiring different methods of implementation, and requested the General Assembly to reconsider its decision to include them in the same instrument. After long debate, the Assembly decided that the Commission on Human Rights should be asked to draft two covenants. The Canadian delegation supported this decision but, believing that much of the material suggested for inclusion in the second covenant amounted to statements of governmental responsibility or of long-term policy objectives, doubted whether these objectives, however desirable, should be written into a legally binding international convention. The Sixth Session of the Assembly requested the Economic and Social Council to hold a special session for the purpose of transmitting its directives to the Human Rights Commission so that the two draft covenants might be available for consideration at the Seventh Session.

Among the subjects that occupied the Economic and Social Council during this period were the world economic situation in general, various regional economic questions, full employment, freedom of information, forced labour and refugees.

Specialized Agencies.—An eleventh specialized agency of the United Nations, the World Meteorological Organization, started functioning in 1951. At the same time, arrangements were made to terminate the International Refugee Organization early in 1952. Continuing problems in connection with refugees will be the concern of the office of the United Nations High Commissioner for Refugees, which was established by the General Assembly in December 1950. The proposed International Trade Organization and the Inter-governmental Maritime Consultative Organization have not yet come into existence.

Subsection 3.—Canada and the North Atlantic Treaty

Within less than two years of the signing at San Francisco of the Charter of the United Nations in 1945, the hopes of people everywhere for universal peace had given place to growing anxiety. The Security Council, which had been given primary responsibility for the maintenance of security, was already ham-strung by the deliberate tactics of the Soviet representatives. The encouragement of communist régimes in countries under control of the Red Army, and activities in other countries, particularly in Western Europe, provided ample evidence of the imperialistic designs of the Soviet Union. Under these circumstances nations that found themselves in common danger of aggression were driven to seek security by special co-operation in defensive measures.

A major step in the search for security by Western nations was taken in the spring of 1948 when the United Kingdom, France, The Netherlands, Belgium and Luxembourg signed at Brussels a treaty providing for their collective self-defence. In the months that followed there were many signs that determined efforts by Western European nations to co-operate for defence would find a ready response in North America. Beginning with the summer of 1948, the Ambassadors of the Brussels Treaty Powers and Canada began holding informatory and exploratory talks at Washington with representatives of the United States. Representatives of other North Atlantic countries were invited to the discussions at a later stage and, on Apr. 4, 1949, the North Atlantic Treaty was signed by twelve nations—Belgium, Canada, Denmark, France, The Netherlands, Iceland, Italy, Luxembourg, Norway,

Portugal, the United States and the United Kingdom. The Treaty was accepted by all major groups of opinion in Canada, and it was passed without a single dissenting vote in Parliament.

In 1952 two important steps were taken to extend the coverage of the Treaty. Greece and Turkey were admitted to membership and their territories were thereby included in the area guaranteed by the Treaty. Various agreements bringing the Republic of Western Germany into defence arrangements with the West were also required, but these will not become effective until ratified. Under these agreements a European Defence Community with a European Army is to be established. Germany will be a member of the EDC along with France, Italy, Belgium, The Netherlands and Luxembourg, and the armed forces in Europe of each of these countries will be part of a European Army which will be under NATO command. Germany will not be a member of the North Atlantic Treaty, although its territory and independence will be guaranteed by all NATO powers.

The Treaty.—The North Atlantic Treaty in its preamble reaffirms the faith of the Parties in the purposes and principles of the Charter of the United Nations, and declares that the Parties “are determined to safeguard the freedom, common heritage and civilization of their people, founded on the principle of democracy, individual liberty and the rule of law”; that “they seek to promote the stability and wellbeing of the North Atlantic area”; and that “they are resolved to unite their efforts for collective defence and for the preservation of peace and security”.*

The defence aspects of the Treaty are covered mainly by Articles 3, 4 and 5. Article 3 provides in part that “The Parties, separately and jointly, by means of continuous and effective self-help and mutual aid, will maintain and develop their individual and collective capacity to resist armed attack”. Article 3 provides also that “wherever in the opinion of any of them, the territorial integrity, political independence or security of any of the Parties is threatened”, they will consult with one another. By Article 5, the Parties agree that an armed attack against any of them shall be deemed an attack against all, and that in the event of such an attack, each will assist the Party or Parties so attacked by taking, individually and in concert with the others, “such action as it deems necessary, including the use of armed force, to restore and maintain the security of the North Atlantic area”.

A fourth basic article is Article 2. This Article, which was largely promoted by Canada, declares:

“The Parties will contribute toward the further development of peaceful and friendly international relations by strengthening their free institutions, by bringing about a better understanding of the principles, upon which these institutions are founded, and by promoting conditions of stability and wellbeing. They will seek to eliminate conflict in their international economic policies and will encourage economic collaboration between any or all of them.”

The course of events since the Treaty was signed has compelled members to give priority to defence and security; nevertheless Article 2 is important, as the affirmation of a long-term objective.

The Treaty Organization (NATO).—Unlike the United Nations Charter, the North Atlantic Treaty has little to say about organization. Article 9 of the Treaty provides merely for the establishment of a Council “to consider matters

* Article 1 further makes clear that the Treaty does not conflict with the United Nations Charter but rather supplements it.

concerning the implementation of this Treaty", and empowers the Council to set up such subsidiary bodies, including a defence committee, as may be necessary to achieve the purposes of the Treaty. This very general provision left the Council free to adapt the organization to meet the needs as they arise.

The Council is the supreme governing body of NATO. The chairmanship rotates annually in alphabetical order of member countries. At the seventh meeting of the Council at Ottawa in September 1951, the Hon. L. B. Pearson, Canadian Secretary of State for External Affairs, became Chairman for the following year.

At an early stage, the Council, which consisted of all the Foreign Ministers of the Parties to the Treaty, established a committee of Defence Ministers, a committee of Finance Ministers, a Military Production Board of high officials representing each government, as well as other subordinate civil bodies and an elaborate structure of military bodies. The Council met as occasion required in various national capitals. These arrangements were found to be rather unwieldy and, at the Lisbon meeting of the Council in February 1952, it was agreed that the civil organization be located permanently at Paris, that the Council operate as a permanent body, and that the members be represented at the seat of the Council by a permanent delegation. It was further agreed that all NATO activities be brought under the control of the Council, and that a strong secretariat be established under a Secretary General who would be Vice-Chairman of the Council and could serve in the absence of the Chairman. These measures were implemented shortly thereafter.

Military Organization.—The Military Committee, on which each member country is represented by one of its Chiefs of Staff, is the senior military organ of the Alliance and comes directly under the Council. It is responsible for providing that body with military advice and receives from it political guidance which is passed on to Supreme Commanders by the Standing Group. As in the case of the Council, the chairmanship of the Military Committee rotates annually in the alphabetical order of NATO countries.

The Standing Group, as its name implies, is a permanent body. It is composed of the Chiefs of Staff of the three major contributors to NATO—the United States, United Kingdom and France—and is responsible for the continuing work in the military sphere. It is located at Washington and gives strategic and political guidance to the Supreme Commanders who come under its orders. The eleven other members of NATO are associated with Standing Group work through a Committee of Military Representatives at Washington consisting of representatives of the Chiefs of Staff of the other member countries. This makes it possible for all to be kept in constant touch with developments.

Direct military command in NATO is exercised by Supreme Commanders. In 1950, General Dwight D. Eisenhower was appointed the first Supreme Allied Commander, Europe, responsible for the defence of Western Europe. He remained in office a little over a year when he resigned and was succeeded by General Matthew Ridgway. Early in 1952 Admiral L. D. McCormick, USN, was appointed Supreme Commander, Atlantic, responsible for the defence of the lines of communication across the Atlantic Ocean. His headquarters are at Norfolk, Va.

The third major strategic division within the area covered by the North Atlantic Treaty is the Canada-United States region. As yet it has no organized command nor is one contemplated for the time being, but defence plans for this area are continuously under study by the Canada-U.S. Regional Planning Group.

Each of the Supreme Commands has an integrated staff to which Canadian officers have been appointed.

Canada's Contributions to NATO.—NATO planning follows to a considerable degree the principle of division of responsibility among member nations. European members, for example, whose territory would be exposed to early attack in the event of war, are expected to concentrate largely on ground forces, including reserves which can be made ready quickly for battle; the United States is responsible for strategic air forces; the principal naval members—the United States, the United Kingdom, and France—provide by far the major portion of naval forces. NATO planning also takes into account that some members have heavy responsibilities outside the NATO area and therefore cannot commit all their forces to NATO commands, at least in peacetime. France, for example, has been conducting major military operations in Indo-China; the United Kingdom has heavy responsibilities in the Middle East, in Malaya and elsewhere; and the United States has extensive commitments in the Pacific area and other regions.

Under agreed NATO plans, Canada contributes to the standing NATO forces in all three armed services. The 27th Infantry Brigade, which was specially organized for NATO purposes, was stationed in Western Germany in the late autumn of 1951. During 1952, Canada plans to station four fighter squadrons of the RCAF in Western Europe, assuming airfields will be available, and to increase these forces to twelve squadrons by 1954. By the end of 1952, twenty-four ships of the Royal Canadian Navy will form part of the forces available to the Supreme Allied Commander, Atlantic (SACLANT), and fifty-two ships by 1954. Canada's prime responsibility is, however, the direct defence of Canadian territory. As already pointed out, no NATO command has been established for the North American region. Consequently, Canadian forces allocated for the direct defence of Canada have not been allocated to a NATO command, although in fact they are defending territory expressly included under the North Atlantic Treaty. Moreover, Canada, as a member of the United Nations, has a Brigade Group participating in halting aggression in Korea, and Canadian forces engaged in those operations could not properly be withdrawn and made available to NATO as long as United Nations operations continue in Korea.

Mutual Aid.—Canada has also made substantial contributions to NATO in the form of Mutual Aid. As pointed out previously, by Article 3 of the Treaty the member nations have undertaken to maintain and develop their individual and collective capacity to resist armed attack "by means of continuous and effective self-help and mutual aid". They have undertaken to build up their own forces and to assist one another to do so in order to resist armed attack. At an early stage, the United States Congress passed large appropriations to assist the re-arming of other countries and much larger appropriations have since been made. At the special session of the Canadian Parliament in September 1950, an appropriation of \$300,000,000 was passed for similar purposes, and a second appropriation of \$325,000,000 was made in 1952. By means of this appropriation it was possible to transfer, free of charge, to other members of NATO considerable quantities of

existing stocks of armament and ancillary equipment which the Canadian Army had been keeping as mobilization reserves. The Canadian Army will be re-equipped by production of new equipment in Canada or purchase from the United States. Armament and equipment for approximately one infantry division was thus given away during 1950-51 to each of Belgium, Holland and Italy following recommendations of the NATO Standing Group, and later considerable quantities of ammunition and armament, such as field and anti-aircraft guns, were given away to various NATO countries. In addition, contracts were let for the production for other NATO countries of such equipment as fighter aircraft, guns, mine-sweepers, and walkie-talkies and other electronic supplies.

Under the Mutual Aid vote, provision was made for the training of aircrew for other NATO countries. This involved the re-opening of many airfields in Canada, the acquisition of large quantities of training equipment and the establishment of a large training staff. By the spring of 1952 about 1,000 aircrew were being trained for other NATO countries while training facilities for the following year were planned to accommodate about 1,400 trainees.

Subsection 4.—Canada and the Colombo Plan

The Colombo Plan for Co-operative Economic Development in South and Southeast Asia was conceived at the Commonwealth Meeting on Foreign Affairs held at Colombo, Jan. 9-14, 1950. Further meetings were held during the same year and in October a report on the Colombo Plan was published which gave a comprehensive picture of the economic requirements and potential resources of the region and the need for external assistance.

Although the Colombo Plan was initiated by Commonwealth governments, it is not exclusively a Commonwealth program. It is designed to assist in the economic development of all countries and territories in the general area of south and southeast Asia.

The Consultative Committee, an intergovernmental body which meets from time to time to review the progress of the Colombo Plan and to consider policy matters in connection with its implementation, now counts as members Australia, Burma, Cambodia, Canada, Ceylon, India, Laos, New Zealand, Pakistan, the United Kingdom and Viet-Nam, as well as the United States which is also engaged in a substantial program of economic aid in the same region.

The Canadian Parliament approved a contribution of \$25,000,000 for capital assistance to governments in south and southeast Asia during 1951-52 and it was subsequently decided that, for this first year of operation of the Colombo Plan, Canadian aid would be divided between India and Pakistan.

At the request of the Government of India, the Canadian Government agreed to allot \$10,000,000 for the provision of wheat to India under the Colombo Plan. The wheat was shipped from Canadian west coast ports during the winter and early spring of 1952. The Indian Government undertook to establish a special counterpart fund equivalent in rupees to the \$10,000,000 expenditure by the

Canadian Government in respect of the wheat, the counterpart funds to be used for the internal financing of economic development projects approved by both Governments. It was agreed that the counterpart funds for the wheat should be used to help finance the Mayurakshi irrigation and hydro-electric project in West Bengal and it was estimated that this work when completed would increase the arable land by 600,000 acres and produce some 4,000 kw. of electric energy. Most of the remaining funds available to India under the 1951-52 program were earmarked for the provision of vehicles to the Bombay State Transport Corporation.

The main project in the Canadian program for Pakistan is a cement plant to be built in the Thal area of the Punjab where a large-scale colonization project is being undertaken by the Pakistan Government. Except for local labour and material, Canada is providing all the equipment, materials and technical personnel necessary for the construction of the plant.

The Canadian, Australian and New Zealand Governments together have agreed to establish and equip an experimental live-stock farm at Thal, the Canadian contribution to this joint project being agricultural machinery and related equipment. The Canadian program for Pakistan also includes such items as a large quantity of wooden railway-ties to be supplied from British Columbia for the urgently needed rehabilitation and development of the Pakistan railway system, and a geological survey, including an aerial photographic unit, which should be of far-reaching benefit to Pakistan in the development of its natural resources.

Another important aspect of the Colombo Plan is the provision of technical assistance to governments in the area. To develop this side of the program, a Council for Technical Co-operation has been set up at Colombo to which Canada has appointed a permanent representative. The Technical Co-operation Program, though an integral part of the Colombo Plan, is designed to supplement the technical assistance activities of the United Nations and the specialized agencies in the area.

For each of the years ended Mar. 31, 1951 and 1952, Parliament authorized appropriations of \$400,000 for technical co-operation under the Colombo Plan. Because of the inevitable delays in the early stages of a program of this kind, these amounts were not fully used. However, the program has been steadily increasing its pace and it is expected that the appropriation of \$400,000, which Parliament made for 1952-53, will be completely taken up.

Up to Mar. 31, 1952, 58 Fellows and scholars from India, Pakistan and Ceylon, had come to Canada for training in such widely varied fields as road and bridge construction, hydro-electric development, public administration, public health and welfare, and agriculture. During the same period, three technical missions, each composed of senior government officials from India and Pakistan, were conducted on observation tours across Canada to study Canadian methods in highway and bridge construction, agriculture, and hydro-electric power installation and development. The greatest difficulty in providing technical assistance has been encountered in locating Canadian experts for service abroad. However, a fisheries consultant from British Columbia has been in Ceylon for some time, assisting the government

in the development of the fishing industry, and a refrigeration engineer is also working in Ceylon in the same field. In addition, the Canadian Government is paying the expenses of a survey being undertaken in Pakistan by the Commonwealth Biological Control Service with a view to setting up a biological control station in that country.

The Consultative Committee on the Colombo Plan held its fourth meeting at Karachi, Pakistan, in March 1952, which was attended by a Canadian delegation led by Mr. George J. McIlraith, M.P. Its main task was to prepare a report on the achievements of the Plan during 1951-52. This Report* outlines the progress made and the plans for 1952-53, and it contains separate sections describing the activities of each member of the Colombo Plan, whether a contributing or a receiving country.

Satisfied that the Plan is operating on a sound basis, Parliament approved a further contribution of \$25,000,000 to provide Canadian economic aid under the Colombo Plan during the fiscal year 1952-53.

NOTE.—*The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.*

The records accumulated at the decennial censuses of Canada since Confederation in 1867 to the latest census, 1951, make a valuable contribution to the demographic history of the nation. Each successive decade has added to the vast scope of the material; the detailed statistical analyses and the numerous monographs and studies available under the several aspects of demography and agriculture have made the census a most important statistical measure of accomplishment and progress. An outline of the history of the census is given in the Year Book 1947, pp. 96-97.

The main legal reason for a periodic census under the constitution of Canada is to determine representation in the House of Commons; this, according to the British North America Act, is based on population (*see* pp. 51-52). The payment of provincial subsidies on a per capita basis is adjusted annually on population estimated from census data. In view of this, each person is counted as belonging to the locality of his regular domicile rather than to the place where he may be at the date of enumeration.

The modern nation-wide census, however important this redistribution purpose, has a much wider sphere of usefulness. It constitutes, through the data collected directly from the people, a true measure of the social and economic progress of the country and can, therefore, be used in the regulation and general administration of public affairs, social security and rehabilitation programs, etc.

At the time of the preparation of this Chapter (July 1952), only the basic figures from the 1951 Census were available and these have been summarized under the respective headings so far as possible. More detailed information and extended analyses will be published from time to time and can be obtained from census publications.

* This Chapter has been revised in the Census (Demography) Division, Dominion Bureau of Statistics.

Section 1.—Growth of the Population

A brief résumé of the population history of Canada from the first census in 1666, when 3,215 persons were enumerated, to the Census of 1951, when the figure was 14,009,429, places Canada among the leading countries of the Commonwealth in the rate of population growth. The total population of Canada at the end of the nineteenth century was approximately 5,400,000; it had about doubled this figure by 1931. The general increase in the population of European countries during the entire nineteenth century was approximately three-fold; Canada equalled this rate of progress during the 60 years from 1871 to 1931.

In the decade 1901-11 immigration alone totalled 1,800,000. This figure was the main factor in the gain of 34·2 p.c. registered by the total population of Canada in that decade, which was relatively larger than the growth of any modern country during the same period.

The next decade started out with an intensification of this immigration movement, but a recession set in with the outbreak of World War I. The effects of that War upon the Canadian population were both direct and indirect. Nearly 60,000 members of the Canadian forces died overseas and approximately 20,000 others took their discharge in the United Kingdom. To these may be added 50,000 deaths from the war plague, influenza. In addition, large numbers of British Isles residents, most of them recent immigrants, left Canada to join the armed forces of the United Kingdom and did not return; the same is true of enemy nationals who passed in considerable numbers into the United States immediately before and after the declaration of hostilities. The fluidity of the Canadian population accordingly rendered the War costly in personnel far beyond actual casualties. However, the net result over the ten years was a population increase of 21·9 p.c. or the largest increase for any modern country in that decade with the exception of Australia where an increase of 22·0 p.c. was recorded.

The Census of 1931 showed a further population increase of 18 p.c. over 1921. Natural increase and immigration contributed 1,325,256 and 1,509,136, respectively, although the net gain was only 1,588,837 since estimated emigration was 1,245,555 for the ten years. Census returns of Great Britain for 1921-31 showed an increase of 4 p.c. as compared with 5 p.c. for the previous decade. New Zealand in the ten-year interval 1911-21 showed an increase of 21 p.c. and in the period 1921-36, 23 p.c. A census of Australia was not taken in 1931, but the official estimate of population based on the Census of 1933 gave an increase of 20 p.c. as against 22 p.c. for the period 1911-21. Census figures for the United States showed an increase in population of 15 p.c. for 1910-20, 16 p.c. for 1920-30 and 7 p.c. for 1930-40.

The Eighth Census of Canada taken June 2, 1941, gave the population as 11,506,655 as compared with 10,376,786 as at June 1, 1931, an increase of 1,129,869 or 11 p.c. in the decade. During the greater part of this decade, Canada, along with all other countries, was faced with a prolonged and severe economic depression; immigration was still further restricted by government regulations as well as by economic necessity. The figures for immigrant arrivals were actually reduced from 1,166,004 in the ten-year period 1921-31 to 140,361 in 1931-41. The natural increase for this period showed a reduction of about 11 p.c. and, since immigration was reduced more than 88 p.c. over the decade, the net increase in population was due almost entirely to the favourable birth and death rates of the established population.

GROWTH IN CANADA'S POPULATION, 1851 - 1951

MILLIONS

The Ninth Census of June 1, 1951, showed the population of Canada to be 14,009,429, representing an increase of 2,502,774 or 21·8 p.c. over the 1941 figure of 11,506,655. Newfoundland's entry into Confederation accounted for 361,416 of this increase. Excluding Newfoundland, the population in 1951 totalled 13,648,013, an increase of 2,141,358 or 18·6 p.c. over the 1941 population of the nine provinces and the territories. This numerical increase is the largest on record and the percentage increase has been exceeded only twice since the turn of the century. In 1921 it was 21·9 p.c. and in 1911, 34·2 p.c. The population increase in this decade is all the more remarkable when consideration is given to the fact that immigration was heavily restricted during the war years. With the resumption of immigration in the post-war years, however, Canada gained some 548,000 in population through immigrant arrivals over the decade. The period 1941-51 was characterized also by high birth rates, and the natural increase was just under 2,000,000 for the ten-year period.

Since 1867, decennial censuses have been taken as at Apr. 2, 1871, Apr. 4, 1881, Apr. 5, 1891, Apr. 1, 1901, June 1, 1911, 1921, 1931, June 2, 1941, and June 1, 1951. Population totals by provinces and territories are given in Table 1, together with figures showing the percentage distribution of population and the numerical and percentage increases in population by decades.

1.—Numerical and Percentage Distribution and Numerical and Percentage Increase of Population, by Provinces and Territories, Decennial Census Years 1871-1951

NOTE.—The populations of the Prairie Provinces in 1906, 1916, 1926, 1936 and 1946 are shown at p. 131 of the 1951 Year Book. Intercensal estimated populations from 1867-1904 will be found at p. 141 of the 1936 Year Book; from 1905-30 at p. 127 of the 1946 edition; and from 1931-52 in Table 9, p. 143, of the present edition.

¹Populations of Newfoundland (which was not part of Canada until 1949) were: 1871, 152,500 (estimated); 1881, 186,500 (estimated); 1891, 202,040; 1901, 222,984; 1911, 242,619; 1921, 263,033; 1931, 281,500 (estimated); 1941, 330,000 (estimated); and 1945, 321,819. ²Includes 485 members of the Royal Canadian Navy d separately in 1921.

The land area and density of the population per square mile is given by provinces Table 2 for the census years 1921-51. It will be noted that the figures for 1951 include the Province of Newfoundland, and this fact should be kept in mind in comparisons with earlier censuses.

¹ Census taken by Newfoundland Government in 1945; 1941 figure not available.

Many of the larger cities of Canada have in their neighbourhoods growing 'satellite' towns or other urbanized areas in close economic and social relationship with the central city. For census purposes, metropolitan areas have been established for these centres to include the cities proper and their satellite communities. The total population of each of the census metropolitan areas in 1951, with the comparable figure from the 1941 Census covering the same area as in 1951, is shown in Table 4.

4.—Populations of Census Metropolitan Areas, 1951, compared with Populations of Same Areas in 1941

¹ Located partly in Alberta.² Not incorporated in 1941.

Table 7 shows the populations of counties and census divisions for the census years 1901 to 1951. In Prince Edward Island, New Brunswick and Ontario census counties correspond closely with the municipal counties of these Provinces. In Quebec, census counties have been subdivided to correspond as far as possible with the additional municipal counties created in this Province. For example, Charlevoix County is divided into Charlevoix East and Charlevoix West and separate figures are shown for each. The Provinces of Newfoundland, Manitoba, Saskatchewan, Alberta and British Columbia have been divided for statistical purposes into census divisions since they have no fixed political divisions corresponding to the counties in other provinces.

Section 2.—Movement of Population

The traditional movement of population on the North American Continent from east to west has not been apparent in Canadian statistics for recent years. The most spectacular changes are shown in the Prairie Provinces and in British Columbia. The three Prairie Provinces lost by migration about 250,000 people between 1931 and 1941 and somewhat more from 1941 to 1951. British Columbia gained at the rate of about 8,000 a year during the 1930's and at about 23,000 a year during the 1940's. On an absolute basis, Ontario received more people than British Columbia but in relation to its larger population this growth was only one-third as important. Quebec's net change was negligible relative to its population. Nova Scotia gained during the 1930's but lost in the 1940's, the Maritime Provinces as a whole losing considerably over the two decades.

8.—Numerical Changes in the Populations of the Provinces, 1931 to 1941 and 1941 to 1951

Section 3.—Intercensal Estimates of Population

Intercensal estimates of the population serve many uses. They constitute a base for vital statistics rates, per capita figures of production and trade, and other analyses. More recently, they have proved useful for estimates of labour force and other population characteristics of data collected in sample surveys.

Estimates are constructed in the first place for the total population of Canada and for each province. It is a requirement that these be made available about the date to which they apply, June 1 of each year. As final figures on the components of population changes are not ready at that date, the numbers of births, deaths and immigrants are partly filled in by extrapolation so that a preliminary figure is secured for the June to May interval. To avoid a cumulative error the calculation, in effect, starts anew with the latest preceding census for each year's estimates and uses the most up-to-date figures then available. To the census figures are added the births of the intervening years and the deaths are subtracted. Immigrants are added and emigrants are subtracted. On the last item of this calculation there is least information; it is possible to ascertain from United States immigration figures the number of Canadians entering the United States and sometimes the number of those going to the United Kingdom but data are not available for other countries.

The program of population estimates calls for two figures to be given in respect of each year; one based on preliminary materials, as described above, necessarily involving an extrapolation of birth, death and immigration returns, and the other on final figures subject to no further change which can be made available only when the last item of subsequent information has been secured. This last item is the succeeding decennial census and with the release of the 1951 Census totals the estimates for the decade 1941-51 were revised; the tables of this Section present the revised figures.

Since estimates for successive years are independently calculated back to the latest census, the best estimate of the balance of population change is not obtained by subtracting the figure for one year from that for the year following. Much interest attaches to the year-to-year balance and the following statement, which gives all available data on that point, is included.

Year	Calendar-Year Data ¹				Estimated Population as at June 1 ¹
	Births	Deaths	Natural Increase	Immig- ration	
1941.....	255,224	114,500	140,724	9,325	11,490,000

* Includes Newfoundland.

9.—Estimates of Population, by Provinces and Territories, Intercensal Years 1931-52

NOTE.—At every census the previous post-censal estimates, made at June 1 each year, are adjusted to the newly recorded population figures. Figures for 1867-1904 will be found at p. 141 of the 1936 Year Book and for 1905-30 at p. 127 of the 1946 edition. Figures for all provinces for 1931, 1941 and 1951 are census figures while those for the Prairie Provinces are for the 1936 and 1946 Censuses.

¹ Estimates for Newfoundland prior to union with Canada, which took place on Mar. 31, 1949, are not included in Canada totals.

Section 4.—Rural and Urban Population

Prior to 1951, the population residing within the boundaries of all incorporated cities, towns and villages of a province was classified as urban and the remainder as rural. Since the laws governing incorporation vary among provinces there was no uniform line of demarcation between the rural and urban population throughout Canada. In the 1951 Census the aggregate size of population within a given area rather than provincial legal status is the main criterion for the rural-urban classification. The population residing in cities, towns and villages of 1,000 or over, whether incorporated or unincorporated, as well as the population of all parts of census metropolitan areas has been defined as urban and that outside such localities as rural.

Table 10 presents the rural and urban population by provinces and territories for the years 1941 and 1951. For comparative purposes the rural and urban population has been tabulated by both the 1941 and 1951 rural-urban definitions. The rural is further classified by farm and non-farm residence and the urban by size of locality in Table 11.

¹ Exclusive of 84,264 persons living on farms in localities classed as "urban".

² Includes a few metropolitan area parts with less than 1,000 population.

Section 5.—Sex and Age Distribution

Sex.—The sex distribution of the Canadian people has been characterized since early colonial times by a preponderance of males, although this condition has been greatly modified in more recent years. In 1666, during the early years of settlement by French immigrants, 63·3 p.c. of the population were males. In 1784, when British immigration to Canada was commencing, there were 54,064 males and 50,759 females and by the middle of the nineteenth century there were 449,967 males to 440,294 females in Lower Canada and 499,067 males to 452,937 females in the more newly settled Upper Canada. Since Confederation the newer sections of Canada—the west and the northwest—have shown the greatest excess of males.

From 1871 to 1941, for Canada as a whole, the proportion of males never dropped below 51 p.c. of the total population, whereas for Western Canada it varied between 53 p.c. and 59 p.c. By 1951, however, the proportion of males to the total population had dropped to 50·6 p.c. for Canada as a whole.

12.—Sex Distribution of the Population, by Provinces or Territories, Census Years 1921-51

NOTE.—Figures for the Censuses of 1871, 1881, 1891, 1901 and 1911 are given at p. 150 of the 1948-49 Year Book.

¹ Includes 485 members of the Royal Canadian Navy recorded separately in 1921.

Age.—The age distribution of a population is fundamental to most, if not all, other analyses, for the age factor influences employment, marriage, birth rates and death rates, education, immigration, criminology and a multitude of events and activities that are of great importance in the national life.

Immigration has a strong influence on age distribution: it does not directly affect the very young sections of the population except to a small degree, but it immediately affects the age groups between the 'teens' and the 'twenties' and its effects are carried to the older groups as time goes by. Thus, the influence of the very heavy immigration of the early years of the century (1900-11) is indicated by the fact that, in 1901, 175·9 persons per 1,000 of the total population were in the age group 20-29 years and 131·3 persons per 1,000 in the group 30-39 years: a decade later, 190·7 per 1,000 were in the former group and 142·8 in the latter. Since immigration slowed down very decidedly after the outbreak of war in 1914, the influence of these earlier accretions to the population has crept through the upper age groups year by year until it has now reached those of the population in their 'fifties'.

Between 1931 and 1941 a more pronounced general ageing of the population is shown owing to practically non-existent migration and a lower birth rate—factors that were emphasized during the depression years. In 1921 the number per 1,000 of total population between 40 and 59 years of age was 183·1; it was 201 in 1931 and 209 in 1941. Greater proportional increases, however, are shown by the group 60 years of age or over; this group represented 75 per 1,000 of the total population in 1921, 84 in 1931 and no less than 102 per 1,000 in 1941.

In 1951 there were 203·19 persons per 1,000 of total population between 40 and 59 years of age and 113·66 in the group 60 years of age or over. However, there were 222·7 persons per 1,000 of total population in the under 10 years of age group in 1951 as compared with 182·3 in 1941, 212·7 in 1931 and 240·0 in 1921.

Table 13 shows the population of Canada classified by five-year age groups and sex for the census years 1931, 1941 and 1951. The provincial distribution from the 1951 Census by specified age groups is shown in Table 14.

Section 6.—Marital Status

Next to sex and age distribution of a population, that of marital status is probably the most fundamental. Its incidence is twofold: 'vital' and 'economic and social'.

The vital basis lies in the influence of the marriage state on the fertility of a population and, from this angle, close analyses of marital status, by age, are important. The ages of females between 15 and 45 years have more significance than those of males; if the proportion of females in this group is small, the expected proportion of births will also be small. It has been shown that for the Canadian population the combined influences of age of the population, age of the married females, and proportion of females married have become steadily more favourable to the birth rate from 1871 to 1921 but that, since the latter date, the trend has been less favourable.

15.—Marital Status of the Population, 15 Years of Age or Over, by Sex, Census Years 1911-51

NOTE.—Persons whose marital status was not stated have been pro-rated and assigned to the various categories shown in this table.

¹ Includes legally separated.

Although Canada has more single than married citizens, information from the 1951 Census shows that the nation's married population grew more than twice as fast as the single population in the decade between 1941 and 1951. With a total population increase of nearly 22 p.c., the number of single persons in Canada increased by 13·5 p.c., married by 32·2 p.c., widowed by 22·5 p.c. and divorced by 128·0 p.c. The entry of Newfoundland into Confederation accounted for 3·3 p.c. of the increase in single persons, 2·9 p.c. in married and widowed persons and 0·5 percent in divorced persons. Other striking statistics of marital status are the excess of married males over married females, the great preponderance of widows compared with widowers and the large and increasing number of divorced persons.

Section 7.—Origins

A population composed of diverse racial stocks gives rise to political, economic and social problems quite different in nature from those of one with a small admixture of foreign elements, although, to the extent that certain racial stocks are more readily assimilated than others, the problems are mitigated. It is equally true that the different educational, moral, economic, religious and political backgrounds of a people of mixed origins lend variety and diversity to the national life.

The two basic stocks of the Canadian people are the French and the English: historically the French is much the older and, excepting at the time of the Census of 1921, has exceeded in numbers any one of the basic British stocks.

For purposes of the census, a person's origin or cultural group is traced through his father. For example, if a person's father is German and his mother Norwegian, the origin is entered as "German". Wherever possible the origin of a person is established by asking the language spoken by the person or by his paternal ancestor when he first came to Canada.

Table 17 shows the population of Canada for the census years 1931, 1941 and 1951 classified by detailed origins, while Table 18 presents the 1951 provincial distribution based on a classification of the numerically largest origins in Canada.

17.—Origins of the Population, Census Years 1931-51

NOTE.—Figures for the Censuses of 1871, 1881, 1901, 1911 and 1921 are given in the 1948-49 Year Book, p. 154.

Section 8.—Religious Denominations

At each census the actual numbers attached to any religious denomination, as reported by the persons enumerated, have been recorded. The distribution of the principal denominations as at the Censuses of 1931, 1941 and 1951 is given in Table 19.

19.—Principal Religious Denominations of the Population, Censuses of 1931-51, with Percentage Distribution 1951

NOTE.—More detailed figures for the Censuses of 1871, 1881, 1891, 1901, 1911 and 1921 are given in the 1948-49 Year Book, p. 155.

¹ Includes other Greek Catholic rites.

Section 9.—Countries of Birth

The census collects information on both country of birth of immigrant arrivals in Canada and province of birth of the native-born. For persons born outside of Canada the country of birth, as constituted at the date of the Census, is recorded. Table 20 gives the total population by country of birth for the census years 1931, 1941 and 1951.

20.—Countries of Birth of the Population, Census Years 1931-51

NOTE.—Figures for the Censuses of 1871, 1881, 1891, 1901, 1911 and 1921 are given in the 1948-49 Year Book, p. 158.

² Includes Lithuania and Ukraine.

³ In-

⁴ Includes Austria, Czechoslovakia, Hungary,

Yugoslavia, Poland and Roumania.

⁵ Includes "birthplace not stated".

Section 10.—Citizenship

Results of the 1951 Census show that 96.85 p.c. of the total population were Canadian citizens while 0.74 p.c. were citizens of other Commonwealth countries, 1.69 p.c. European countries, 0.11 p.c. Asiatic countries, 0.49 p.c. the United States and 0.12 p.c. other countries. Information from the 1951 Census on the citizenship of the population classified by birthplace was not available at the time of the preparation of this Chapter. Figures from the 1941 Census are given in Table 22. According to that table, over 80 p.c. of the United States-born persons in Canada, who formed 2.7 p.c. of the total population, had become Canadian citizens together with 74.7 p.c. of the Continental European-born; of those born in Asiatic countries, 72.7 p.c. remained aliens. Of the total population, only 2.4 p.c. were aliens.

¹ Includes 21,515 British-born persons who had not, at the date of the Census, acquired Canadian domicile.

Section 11.—Languages and Mother Tongues

Official language is not to be confused with mother tongue. Mother tongue is the language a person first spoke in childhood and still understands; official language refers only to the English and French languages. The numbers speaking one; both or neither of the official languages are given, by provinces, in Table 23. Information from the 1951 Census on official languages classified by origin was not available at the time of preparation of this Chapter. Such data for 1941 will be found in the 1947 Year Book, p. 122.

23.—Population Speaking One, Both or Neither of the Official Languages, by Provinces or Territories, 1951

NOTE.—Children under 5 years of age have been classed as speaking the language of the home.

Province or Territory	Official Language				Total
	English Only	French Only	English and French	Neither English nor French	
Newfoundland.....	356,377	153	3,990	896	361,416

Section 12.—School Attendance

Years of schooling is defined as the total number of years a person attended any kind of educational institution beyond kindergarten. Persons engaged in private study or part-time attendance at classes are credited with the number of years of formal schooling to which this is equivalent. Table 25 shows the number of persons 5 years of age or over attending school by years of schooling, by provinces and the Territories, while Table 26 shows this information for persons not attending school. To be considered as attending school, a person must have had some regular daytime attendance at some type of formal school or university between September 1950 and June 1951.

25.—Population 5-24 Years of Age or Over Attending School, by Years of Schooling, by Provinces or Territories, 1951

Section 13.—Occupations

Information under this heading from the 1951 Census was not available at the time of preparation of this Chapter but may be found in the regular series of census bulletins. Summary tables showing the occupations of the Canadian people as at the date of the 1941 Census are given in the Year Book 1943-44, pp. 1062-1073, and in the Year Book 1948-49, pp. 160-161.

Section 14.—Dwellings, Households and Families

Statistics on dwellings, households and families, derived from the 1951 Census returns, are shown in Table 27; the figures are exclusive of the Yukon and Northwest Territories. Additional information on these subjects, which was not available at the time of preparation of this Chapter, may be found in the regular series of census bulletins.

The definitions on which the figures of Table 27 are based are as follows:—

Dwelling.—A structurally separate set of living premises with private entrance from outside the building or from a common hallway or stairway inside. The entrance must not be through another person's living quarters. Each single house, each apartment or suite in an apartment house, duplex, triplex or structurally connected single house; each flat in a building containing flats; each half of a double house; and each section of a row or terrace counts as one dwelling unit. Other structures such as summer cottages, automobile trailers, tents, cabins, railway cars, houseboats, etc., are also counted as dwelling units if they are occupied by persons who have no other usual residence.

Household.—A person or a group of persons occupying one dwelling unit. Every individual is a member of some household. The number of households will be equal to the number of occupied dwellings. A household usually consists of a family group with or without servants, lodgers, etc. However, it may consist of a group of unrelated persons sharing a dwelling, or one person living alone.

Family.—A husband and wife (with or without children) or a parent and unmarried child (or children including guardianship children under 21 years of age and single) living together in the same dwelling.

27.—Dwellings, Households and Families, and Persons per Household and Family, by Provinces and Cities of 30,000 Population or Over, 1951

² Excludes institutions, hotels and camps. ³ Includes the Yukon and Northwest Territories.

Section 15.—The Blind and Deaf Population

Information under this heading from the 1951 Census was not available at the time of preparation of this Chapter. Statistics from the 1941 Census are given in the Year Book 1945, p. 126, and in greater detail in Vol. IV of the 1941 Census.

Section 16.—Census of the Prairie Provinces

The Census and Statistics Act of 1905 and the Statistics Act of 1918 (replaced by the Statistics Act, 1948) provided for a census of population and agriculture for the Provinces of Manitoba, Saskatchewan and Alberta, to be taken in 1906 and every tenth year thereafter, in addition to the nation-wide decennial census.

The latest Prairie Province Census was taken as of June 1, 1946, and the results are summarized in the Year Book 1948-49, pp. 162-171, and in the Year Book 1951, pp. 130-132. More detailed information may be obtained in the census volumes of the 1946 Census of the Prairie Provinces.

Section 17.—The Indians and Eskimos of Canada

The Indians.*—The Indians of Canada are not one race, but are divided into a number of basic linguistic stocks or language groups which are, in turn, subdivided into tribal groups with many local dialects. There are ten linguistic groups, of which four are found east of the Rocky Mountains—Algonkian, Athapaskan, Iroquoian and Siouan—and six are found west of the Rockies—Kootenayan, Salishan, Wakashan, Tsimshian, Haida and Tlinkit. They are subdivided further into many tribes with widely differing physical and psychological characteristics and cultures. The Indians of Algonkian stock are the most numerous. They are scattered throughout the area from the Atlantic Ocean to the Rocky Mountains and include such tribes as the Miamaes of Prince Edward Island, Nova Scotia and New Brunswick, the Montagnais of Quebec, and the Ojibwas, Crees and Blackfeet. Iroquoian stock, including the Hurons, are found mainly in Ontario and Quebec. Athapaskan stock inhabit the Northwest and Yukon Territories, while tribes of Sioux are located in Manitoba, Saskatchewan and Alberta.

In all there are more than 136,000 Indians in Canada, divided into about 600 bands. Reserves, or lands set aside for the use of these Indian bands, number more than 2,000, varying in size from a few acres to 500 sq. miles.

The Indians have long been regarded as a separate and special responsibility of the Government and their administration is now under the jurisdiction of the Indian Affairs Branch of the Department of Citizenship and Immigration, except for medical and health services which are provided by the Department of National Health and Welfare. The primary function of Indian administration has always been to conduct Indian affairs in such a manner as to enable them to become increasingly self-supporting and independent. The legislation in effect up to September 1951 covered management of Indian lands and reserves, trust funds, welfare projects, relief, family allowances, education, descent of property, rehabilitation of Indian veterans on reserves, Indian treaty obligations, enfranchisement of Indians and a variety of other matters. A complete examination of Indian affairs was conducted by a special Joint Committee of the Senate and House of Commons during the Parliamentary Sessions of 1946, 1947 and 1948, and, as a result, the previous legislation under which Indian affairs were administered was repealed and a new Act (15 Geo. VI, c. 29) brought into force on Sept. 4, 1951. This constituted the first complete revision of Indian legislation since 1880.

The New Indian Act.—The new Act is designed to bring the Indians, by progressive steps, into a position of social, political and economic equality with other Canadians by giving them greater powers over their own lands and funds and by decreasing the powers held by the Government.

Under the old Act, for instance, the Crown could grant timber-cutting rights on Indian reserves and lease unused lands without the consent of the Indian owners. Such transactions now require the approval of the band concerned. Similarly,

*Prepared under the direction of Laval Fortier, Deputy Minister, Department of Citizenship and Immigration. This material brings up to date the more detailed review given in the 1951 Year Book, pp. 1125-1133.

expenditures from Indian trust funds must now, with few exceptions such as assistance for indigents, be authorized by the band council concerned. A band may now be given complete control over its own lands and band revenue money. Also when an individual Indian leases land to another party the lease money may now be paid locally. Heretofore, under the Consolidated Revenue and Audit Act, it was necessary for the money to be sent first to Ottawa.

The system of elections for band councils, which correspond in a general way to the councils in a rural municipality, has been modernized. Under the old Act only males 21 years of age or over were allowed to vote in band elections. Under the new Act the vote has been extended to women in elections and in all matters in which a vote of the band is required.

The right of appeal to the civil courts in registration of band membership matters is provided for. A similar right is also provided in connection with the estates of deceased Indians administered by the Minister, when the amount involved exceeds \$500.

Revolving Fund loans which formerly assisted Indians in the purchase of farming and fishing equipment, seed grain, live stock and similar essentials, may now be granted also for the purchase of farm vehicles, fencing materials, gas and oil, and repairs and wages.

Restrictions on trade with Indians in the Prairie Provinces have been modified. The requirement for departmental consent to such transactions hitherto necessary may now be removed from any band or individual Indian. In this and various other ways the rights and liberties of the Indians have been extended.

Changes have also been made in regard to education and, while the school system on the reserves will not be changed and the present residential school arrangements will continue, provision is made for the children of Indians living off reserves. Special schools may be established in some cases and, in addition, agreements may be entered into with provincial authorities, local school boards and other bodies for the education of Indian children in association with other Canadian children.

As in the old Act, provision is made for the enfranchisement of Indians—either by entire bands or as individuals—the effect of which is to remove all legal distinctions between such Indians and other members of the community. Enfranchised Indians, accordingly, are no longer subject to the provisions of the Indian Act. A provision has been included permitting the Department to make arrangements with a province or municipality to provide financial assistance to support indigent, infirm or aged persons of an enfranchised band.

Indian Welfare.—The extension of the provisions of the Old Age Security Act to all Indians 70 years of age or over was the most important welfare development during 1951. Formerly, Indians 70 years of age or over were paid, subject to a means test, the sum of \$25 per month which was provided for in welfare appropriations of the Indian Affairs Branch. Also during 1951 the registration was undertaken of needy Indians in the 65-69 age group for benefits under the Old Age Assistance Act.

Other significant steps in Indian welfare included the liberalization of the basic scale of foods issued to destitute Indians, and the appointment of three additional social workers for duty on Indian reserves. These workers, who provide leadership in community activities among Indians, are at work in almost all reserves. The Indian Affairs Branch also continued its policy of improving existing Indian dwellings and constructing new homes on reserves.

Indian Education.—There was a total enrolment of 24,871 pupils in Indian day schools and residential schools during the 1950-51 school year. In addition, 1,468 children attended elementary grades in provincial and private schools and 564 pupils were enrolled in secondary grades and special courses in these institutions. It is significant to note that over a ten-year period the total enrolment at day and residential schools rose from 17,425 to the 1950-51 figure of 24,871, and that during that same period the percentage of attendance climbed from 82.4 to 89.7. These increases are attributed not only to the continuing construction of schools where necessary but also to the growing recognition by the Indians of the desirability of education and to the improvements in the standards of teachers and of schools and equipment.

Fur Conservation.—The fur rehabilitation work carried on in co-operation with the various provinces is continuing. Indians are adopting in increasing measure the conservation and management techniques necessary to restore this basic industry, on which more than one-half of the total Indian population still depends for subsistence.

Beaver production figures have risen steadily in areas in Manitoba, Saskatchewan and Ontario under management by virtue of formal agreements now in effect. For example, the beaver crop in Manitoba rose from 3,379 in 1945 to 14,439 in 1950; in Saskatchewan, from 1,646 in 1947 to 10,495 in 1950; and in Ontario, from 47,276 in 1947 to 73,759 in 1950. Numbers of beavers, as well as the pelts taken, have continued to increase on the areas set aside by the Province of Quebec for the exclusive use of Indians.

Six full-time fur supervisors are now employed across Canada to assist the Indians to derive the fullest possible benefits from trapping operations.

Indian Trust Fund.—The credit balance of the Indian trust fund as at Mar. 31, 1951, was \$20,232,930, made up of \$15,103,948 in capital account and \$5,128,982 in revenue account which, at the end of the year, showed increased balances of \$270,149 and \$818,951, respectively. Interest paid by the Government on the trust fund amounted to \$956,512. Other major items of income to the fund included land leases, \$473,779; timber, \$492,559; oil exploration rights, \$758,559; and land sales, \$97,973. The total expenditure from the trust fund in the year ended Mar. 31, 1951, was \$2,764,222, chiefly for agricultural assistance, relief, distributions of cash in accordance with the provisions of land surrenders, housing construction and improvements, road building, and loans to Indians.

Statistics.—The Indian Affairs Branch takes a census of the Indians at five-year intervals. The figures in the following tables are the latest available. At the time of the preparation of this material, information regarding the Indian population collected at the 1951 Decennial Census was not yet ready for publication.

The Eskimos.—The Eskimos of Canada are located principally north of the tree-line along the northern fringes of the mainland and around the coasts of the islands in the Arctic Archipelago and in Hudson Bay. Most of them are coastal dwellers obtaining much of their food, fuel and clothing from the mammals of the sea. There are, however, small bands living in the interior of the Districts of Keewatin and Mackenzie who depend almost wholly on caribou and fish.

The economy of these nomadic people is based on their hunting, fishing and trapping. From their hunting and fishing they obtain the essentials of food, fuel, clothing and shelter, while trapping produces furs to trade for the white man's goods. Variations in the availability of game and furs and wide fluctuations in the prices of furs from year to year add to the precariousness of the Eskimo's life in these Arctic regions.

The 1951 Census established the Eskimo population at 9,733, of whom 6,822 were located in the Northwest Territories, 1,958 in northern Quebec and 769 in Newfoundland and Labrador.

The administration of Eskimo affairs comes under the Department of Resources and Development whose aim it is to assist these people in adjusting themselves to changes being brought about by advancing civilization and ultimately to develop to a point where they can assume the full rights and responsibilities of citizenship.

The question of the ability of wildlife resources to support the native population is becoming acute. To conserve the natural resources necessary for the subsistence of the Eskimos, the Administration has introduced game preserves where only natives may hunt and trap. Game regulations provide for the efficient use of wildlife, and the Royal Canadian Mounted Police encourage hunting practices which will conserve the supply of game both on land and in the sea. The Federal Government, for a number of years, has operated a reindeer project near Aklavik, which was undertaken primarily as a possible means of improving the economic condition of the Eskimos. Research is going on to determine the suitability of other areas for reindeer culture and to determine the possibility of developing other resources such as fisheries. Eskimo handicraft is being encouraged by the Canadian Handicrafts Guild assisted by a grant from the Federal Government. Eskimos have produced carvings in soapstone, ivory and wood, and articles made of various skins and furs. Sales have been successful.

Social services available to the citizens of Canada in general are being extended to the Eskimos as rapidly as possible, care being taken that these services are extended in a manner and form conducive to the best interests of the native. Family allowances to Eskimos are issued in the form of goods, and allowances to aged Eskimos have also been authorized.

Medical care and hospitalization of Eskimos is a function of the Department of National Health and Welfare. Mission hospitals, maintained with Government assistance, are located at Aklavik, Chesterfield Inlet and Pangnirtung. At these points the Department of National Health and Welfare also maintains medical health officers who are responsible for the surrounding areas. Government nursing stations or health centres have been established at Coppermine, Coral Harbour, Cape Dorset and Lake Harbour in the Northwest Territories and at Fort Chimo and Port Harrison in Arctic Quebec.

The nomadic life of the Eskimo people places considerable difficulty in the way of formal education. For many years the missionaries have carried on some formal education assisted by Federal Government grants. Government schools have now been established at Aklavik, Tuktoyaktuk, Coppermine, Chesterfield Inlet, Coral Harbour, Cape Dorset, Port Harrison and Fort Chimo, and attention is being directed to the devising of a suitable educational program for the Eskimos.

The Royal Canadian Mounted Police detachments maintain close contact with the Eskimos throughout the Far North and act as local representatives of the Administration in all matters affecting Eskimo welfare. Administrative contact is also maintained by radio and through the Eastern Arctic Patrol, which carries representatives of the Administration and of other government departments on an annual inspection of conditions in the Eastern Arctic. Officers of the Administration also visit Arctic posts periodically by aircraft.

Section 18.—Statistics of World Population

Population for each country or area of the world, according to the latest census and latest official estimate, is given in the Year Book 1950, pp. 176-180. The following table gives areas and estimates of populations of the Commonwealth, by continents and countries.

32.—Areas and Populations of the Commonwealth, by Continents and Countries, 1950

NOTE.—The figures in this table are from the *United Nations Demographic Yearbook, 1951*. Populations are mid-year estimates for 1950.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

PART I.—IMMIGRATION AND EMIGRATION

Section 1.—Immigration

Immigration to Canada since early times has been spasmodic, being high in periods of rapid development and prosperity and dropping off during wars and in periods of economic depression. A brief summary of the history of immigration is given in the Year Book 1948-49, pp. 172-173.

Subsection 1.—Immigration Policy and Administration*

Policy.—The present policy of the Federal Government is to foster the growth of the population of Canada by the encouragement of immigration and, by necessary legislation and vigorous administration, to ensure the careful selection and permanent settlement of such numbers of immigrants as can be absorbed advantageously in the national economy. In line with this policy, the regulations were amended on July 1, 1950, to include—in addition to certain British subjects, citizens of France, citizens of the United States, and non-immigrants who served in the Canadian Armed Forces—any European immigrant who complies with immigration regulations and can satisfy the Minister of Citizenship and Immigration that he is a suitable immigrant, having regard to the climatic, social, educational, industrial, labour or other conditions or requirements of Canada, and that he is not undesirable owing to his probable inability to become readily adapted and integrated into the life of a Canadian community and to assume the duties of Canadian citizenship within a reasonable time after his entry.

On Sept. 14, 1950, German nationals were removed from the enemy alien category and have since been admissible as immigrants on the same basis as other Europeans. Regulations governing Asian immigration were also widened. An Order in Council of Dec. 28, 1950, provided for the admission of husbands of Asian origin in addition to the wives of Canadian citizens legally admitted to and resident in Canada. The age limit for unmarried children was raised from 18 to 21 years.

* Revised in the Immigration Branch under the direction of Laval Fortier, Deputy Minister, Department of Citizenship and Immigration.

In January 1951 an agreement was reached with the Government of India to permit the admission of 150 citizens annually. In addition, the wife, husband or unmarried children under 21 years of age of Canadian citizens of Indian origin legally admitted to and resident in Canada may be admitted. Subsequently, provision was made for the admission of 100 citizens of Pakistan and 50 citizens of Ceylon annually, with the same provisions obtaining in respect of members of the immediate family of persons of Pakistani or Ceylonese origin residing in Canada.

However, this widening of regulations was in itself insufficient to increase the flow of immigration. Several obstacles remained to be overcome, the more important being the shortage and high cost of ocean transportation, restrictions on the export of capital and the devaluation of foreign currencies. Measures were taken by the adoption of the Air Transportation Scheme and the Assisted Passage Loan Scheme to help overcome the transportation problem. Under the terms of the former Scheme, put into effect in December 1950, immigrants were enabled to utilize otherwise vacant seats on scheduled Trans-Canada Air Lines flights from the United Kingdom at a cost equivalent to tourist-class ocean passage, the balance of the regular air-passages fare being paid by the Federal Government. Up to Nov. 30, 1951, about 7,000 immigrants had been brought to Canada by this means.

The Assisted Passage Loan Scheme was put into effect on Feb. 1, 1951, for the purpose of assisting immigrants from Europe whose services were urgently required in Canada and who were unable to finance transportation costs. Single persons and heads of families were allowed interest-free loans of part of the cost of ocean transportation and inland rail fare, including meals *en route*, to destination in Canada. Repayment was required within a maximum period of 24 months after arrival in Canada. Up to Oct. 31, 1951, when the plan was suspended, a total of 9,870 workers had been brought to Canada under this arrangement.

In addition to these measures, the Department of Citizenship and Immigration made a determined effort to have more shipping made available, increased the size of its overseas staff, added to its overseas offices, and made a large supply of informational material available to prospective immigrants.

The success of these efforts to stimulate immigration is evidenced by the fact that during the year 1951 a total of 194,391 immigrants entered Canada as compared with 73,912 in the previous year.

Administration.—The responsibility for all immigration matters under the provisions of the Immigration Act rests with the Minister of Citizenship and Immigration. The Immigration Branch, one of the four branches comprising the Department of Citizenship and Immigration, administers this Act. Headquarters of the Immigration Branch is at Ottawa.

A primary objective of administration is to assist immigrants to become quickly and satisfactorily settled in the Canadian community. Through the work of the Settlement Service, the Immigration Branch and the Canadian Citizenship Branch of the Department of Citizenship and Immigration and the National Employment Service of the Department of Labour, the Federal Government continues its interest

in them. Liaison is maintained between the Federal Government and provincial authorities and private organizations with a view to co-ordinating the efforts in this field, filling gaps and eliminating duplication.

Immigration Operations.—Immigration services in Canada and overseas operate under the supervision of the Director of Immigration. In Canada there are five districts—Atlantic, Eastern, Central, Western and Pacific—each under the supervision of a Superintendent. There are 319 ports of entry along the Canadian-United States border and on the Atlantic and Pacific seabords and the admissibility of every person who enters Canada is established by an Immigration Officer at one of these ports. At inland offices located at strategic points throughout the country applications for the admission of immigrants are investigated and deportation proceedings conducted.

Immigration offices in the United Kingdom are located at London, Liverpool, Glasgow and Belfast. To facilitate compliance with immigration medical requirements, approved British medical practitioners make it possible for British immigrants to undergo medical examination within a short distance of their place of residence. An immigration office is also located at Dublin, Ireland. Immigration offices are in operation at Paris, Brussels, The Hague, Stockholm, Berne, Rome, Athens, Oslo, Copenhagen, Helsinki, Hanover, Linz and Carlsruhe.

For the past twenty-five years, a system of preliminary examination of immigrants from Continental Europe has been in effect. This examination is intended to establish, before they embark, the admissibility of persons wishing to settle in Canada in order to avoid the hardship that would ensue from rejection at the Canadian port of entry and subsequent deportation.

Settlement Service.—Of increasing importance in the immigration program is the work of the Settlement Service, which has staffs in all provinces of Canada and in the British Isles. The Settlement Officers in Canada locate and develop opportunities for immigrants in accordance with the needs of the areas under their supervision, enlist the co-operation of provincial and municipal authorities, and advise voluntary organizations that take an active interest in the establishment of immigrants. It is the responsibility of Settlement Officers overseas to locate suitable immigrants to fill the needs ascertained and the opportunities developed by the Canadian section of the Settlement Service. A continuous two-way flow of up-to-date information exists between the officers of the Settlement Service in Canada and those overseas.

Subsection 2.—Immigration Statistics

Table 1 presents statistics of immigration to Canada from 1912 to 1951. Analyses showing place of last permanent residence, sex, age, marital status, birth-place, origin, nationality, destination and occupation for recent years are given in Tables 2 to 8.

1.—Immigrant Arrivals, 1912-51

NOTE.—Figures for 1852-93 are given at p. 153 of the 1942 Year Book and for 1894-1911 at p. 175 of the 1948-49 edition.

¹ Includes U.S.A. citizens on permit but applying for permanent residence.

Sex, Age and Marital Status.—Of the total immigrants 18 years of age or over entering Canada in 1951, 64 p.c. were males. Before 1931, adult male immigrants normally exceeded females in number, but from 1931 to 1947 female immigrants outnumbered male immigrants almost consistently, particularly in 1945 and 1946 when the wives of Canadian service men were coming in. From 1947 to 1950 adult males again exceeded females by from 10 to 27 p.c. and in 1951 by 80 p.c.

Throughout the years the sex distribution of persons under 18 years of age has been fairly even. In 1951, of the 45,334 immigrants in this class, 39,474 or 87 p.c. were under 15 years of age.

Of the total male immigrants in 1951, 40 p.c. were married and 59 p.c. single, the remainder being widowed or divorced; the percentages for female immigrants were 50 and 44, respectively.

3.—Sex Distribution of Immigrants as Adult Males, Adult Females, and Children, 1942-51

NOTE.—Figures for 1930-41 are given at p. 183 of the 1946 Year Book.

Birthplace.—British-born immigrants to Canada in 1951 numbered 35,179 and made up 18 p.c. of the total immigration; the increase over 1950 amounted to 120 p.c. Immigrants born in Continental Europe totalled 148,480, which was an increase of 201 p.c. over the previous year. They accounted for 76 p.c. of the immigration compared with 67 p.c. in 1950. Of the 148,480, 16.3 p.c. were born in Germany, 16.0 p.c. in Italy, 12.6 p.c. in the Netherlands and 12.1 p.c. in Poland.

The number of United States-born immigrants in 1951 was about the same as in 1950, but accounted for only 3 p.c. of the total as compared with 8 p.c. in 1950.

5.—Birthplaces of Immigrant Arrivals, 1949-51

NOTE.—Figures for 1942-46 are given at p. 178 of the 1948-49 Year Book and those for 1947 and 1948 at p. 145 of the 1951 edition.

Intended Destination and Occupation.—Experience has shown that not all immigrants reach the province of intended destination or follow intended occupation. Table 8 gives intended destination and occupation as stated by the immigrants entering Canada in 1951. Of the total immigrants, 41 p.c. were dependent wives and children, 13 p.c. were classed as farm workers, 17 p.c. as skilled workers and 16 p.c. as unskilled workers, while 6 p.c. were in the clerical, professional and merchant classes.

Of the total female immigrants, aside from dependent wives and children who accounted for 75 p.c., the largest number in any one occupational class were listed as domestic servants followed by the clerical and professional classes. Only 2 p.c. were classed as skilled workers.

Rejections and Deportations.—The Immigration Act provides for the rejection and deportation of immigrants belonging to prohibited classes, and also for the deportation of those who become undesirables within five years after legal entry. The results of the operation of these regulations are shown in Table 9.

9.—Rejections and Deportations of Immigrants and Others, by Causes and Nationalities, 1949-51

NOTE.—Figures for 1903-48 are given in the corresponding tables of previous Year Books; those for 1940-48 are given in the 1951 edition, p. 150.

Section 2.—Emigration

Emigration from Canada is an important factor tending to offset the immigration activities of the past and has attained considerable proportions at certain periods. The two main factors have been the migration to the United States of Europeans originally immigrating to Canada and the emigration of native-born Canadians.

A question of considerable interest to Canadians is that of the permanent movement of population between Canada and the United States. In view of the lack of Canadian statistics on emigration, Table 11 has been compiled from figures supplied by the Immigration and Naturalization Service of the United States Department of Justice. Not all the statistics are available by months, so that it has not been possible to present the figures on a calendar-year basis; they are, therefore, shown on that of the United States fiscal year, July 1—June 30. The column headed "Deportable Aliens Destined to Canada" covers persons permitted to return to Canada in lieu of deportation proceedings.

11.—Presumed Permanent Movement of Population between Canada and the United States, Years Ended June 30, 1942-51

NOTE.—Figures for 1933-34 are given at p. 168 of the 1942 Year Book; for 1935-41 at p. 184 of the 1948-49 edition.

³ Including Newfoundland.

PART II.—CANADIAN CITIZENSHIP*

An outline of early naturalization procedure and events leading up to the passing of the Canadian Citizenship Act is given in the Year Book 1951, pp. 153-155.

Section 1.—The Canadian Citizenship Act

The coming into force of the Canadian Citizenship Act on Jan. 1, 1947, marked a new milestone in Canadian history. The passing of this Act exemplified the growth of autonomy in Canada and the advance of Canadian nationhood. Its purpose is to give a clear definition of Canadian citizenship and to provide an underlying community of status for all the people of Canada, helping to bind them together as Canadians.

On Jan. 18, 1950, the administration of Canadian citizenship was transferred from the Department of the Secretary of State to the newly established Department of Citizenship and Immigration. This change has been of considerable benefit in the co-ordination of administrative matters respecting citizenship and immigration, which are interrelated. It has had the additional effect of bringing citizenship to the status of a separate department wherein it is possible to advance materially the scientific planning of education and training in respect to the value and the importance of citizenship in Canada.

The provisions of the Citizenship Act with the changes occasioned by the 1950 and 1951 amendments are outlined in the following paragraphs.

Natural-Born Canadian Citizens.—The Act defines the status of natural-born Canadians before and after the coming into force of the Act, including persons born in and outside of Canada and those born on a Canadian ship or aircraft. A person born outside of Canada out of wedlock is a Canadian citizen if his mother was born in Canada, or on a Canadian ship or aircraft, or was a British subject with Canadian domicile, and had not become an alien. A person born outside of Canada of a Canadian parent before Jan. 1, 1947, is not a Canadian citizen unless, at the commencement of the Act, he had been admitted to Canada for permanent residence, or was a minor. If he was born after Jan. 1, 1947, he is a Canadian citizen, but he ceases to be a Canadian citizen upon reaching the age of two years unless, within that period, or within such extended period as may be authorized in special cases by the Minister, his birth is registered with an official Canadian representative abroad, or with the Minister of Citizenship and Immigration. In addition, a Canadian born outside of Canada before or after Jan. 1, 1947, ceases to be a Canadian citizen unless, within one year of age 21 (or within such longer period as may be authorized), he files a declaration of retention of Canadian citizenship and, in the case of dual nationality, a declaration renouncing the other nationality or citizenship. A Canadian citizen, whether he is abroad or at home, may obtain a certificate of proof of his Canadian citizenship upon payment of a fee of \$1. Under previous Acts, there was no provision for the issue of certificates of proof of citizenship.

British Subjects, Commonwealth Citizens, Citizens of the Republic of Ireland, and Canadian Citizens.—Sect. 21 of the Citizenship Act states that a Canadian citizen is a British subject. Before Jan. 1, 1947, he could not, officially,

* Prepared in the Canadian Citizenship Branch under the direction of Laval Fortier, Deputy Minister, Department of Citizenship and Immigration.

describe himself as a Canadian citizen because the official designation for Commonwealth citizens was British subject. Now, he may officially call himself a *Canadian*. The authority for this procedure is found in Sect. 3 of the Act, which reads:—

“Where a person is required to state or declare his national status, any person who is a Canadian citizen under this Act shall state or declare himself to be a Canadian citizen and his statement or declaration to that effect shall be a good and sufficient compliance with such requirement.”

The rights of non-Canadian British subjects have not been changed or infringed upon by the new Act. They continue to have the right to vote in federal, provincial and municipal elections, but they are not Canadian citizens until they have lived five years in Canada. Those who had that residence (Canadian domicile) on Jan. 1, 1947, are Canadian citizens, and those who attain it after that date must apply for certificates of citizenship before being granted the status of Canadian citizens. The application may be made to the Minister of Citizenship and Immigration or, alternatively, to the court of the district in which the applicant resides. If the Minister is in any doubt as to the qualifications of the person who applies direct to him, he may refer the case to the court for consideration.

Citizens of the Republic of Ireland, who are not British subjects, have a special status in Canada. This status is set out in Sect. 23 (3) of the Act, as amended, as follows:—

“Any law of Canada, including this Act, and any regulation made under the authority of any law of Canada shall, unless it otherwise provides, have effect in relation to a citizen of the Republic of Ireland who is not a British subject in like manner as it has effect in relation to a British subject.”

Canadian Citizens other than Natural-Born.—Under Sect. 9 of the Act, persons naturalized in Canada before Jan. 1, 1947, and British subjects who had Canadian domicile at the commencement of the Act are Canadian citizens. Sect. 9 also defines the status as Canadian citizens of women and children, other than natural-born, and the manner in which they would have acquired Canadian citizenship.

Reinstatement of Persons of Canadian Origin Naturalized Outside of Canada.—By the amendment of July 20, 1950, the Minister may, in his discretion, grant a certificate of citizenship under Sect. 10 (4) of the Act to a person who was a natural-born Canadian, or who was a British subject of Canadian origin, and who lost such status by naturalization outside of Canada or for any reason other than marriage. The application is made direct to the Department and the qualifications are continuous residence in Canada for a period of one year immediately preceding the date of the application, and certain other general qualifications.

Status and Procedure of Non-Canadians to Canadian Citizenship.—Under Sect. 10 (1) of the Act any person who is not a Canadian citizen or is not otherwise a British subject, and is a resident of Canada, may take the first step towards citizenship at any time after his admission to Canada and after he has attained the age of 18 years by filing a Declaration of Intention in the office of the clerk of the court of the district in which he resides. He must then wait not less than one year, and not more than five, before filing with the court his application for citizenship, provided he has reached age 21. He must satisfy the court that he has resided in Canada for one year immediately preceding the date of his application, and a further period of four years in Canada during the six years immediately preceding the date of the application, making a total residence of five years. If

he served outside of Canada in the Armed Forces of Canada during time of war, or if the applicant is the wife of and resides in Canada with a Canadian citizen, the residence of one year immediately preceding the date of the application is all that is required. Additional requirements are lawful admission to Canada for permanent residence, good character, an adequate knowledge of English or French (such knowledge not required if he has resided continuously in Canada for more than 20 years), an adequate knowledge of the responsibilities and privileges of Canadian citizenship, and an intention, if his application is granted, either to reside permanently in Canada or to enter or continue in the public service of Canada or of a province thereof.

When the judge has given his decision, the papers and the decision are forwarded to the Minister of Citizenship and Immigration who may, in his discretion, grant a certificate of citizenship. When a certificate is granted, it is forwarded to the clerk of the court, who then notifies the applicant to appear in court for the purpose of taking the Oath of Allegiance and Declaration of Renunciation of Foreign Allegiance and receiving his certificate of citizenship.

If the application is rejected by the court or by the Minister, the applicant must wait two years before filing a new application.

Status of Married Women.—A Canadian woman does not lose Canadian citizenship upon marriage to an alien, and a non-Canadian woman does not become a Canadian citizen upon marriage to a Canadian citizen. In the former case, she may file with the Minister a Declaration of Renunciation of Canadian citizenship if she has acquired her husband's nationality, and she thereupon ceases to be a Canadian citizen. In the latter case, a non-Canadian woman must apply to the court for a certificate of citizenship. If she is a citizen of another Commonwealth country, she may apply direct to the Minister. The one concession as to qualifications is a residence of only one year in Canada.

A woman of Canadian origin who ceased to be a British subject by reason only of her marriage to an alien prior to Jan. 1, 1947, may regain her status and be granted a certificate of citizenship under Sect. 10 (3) of the Act upon application direct to the Department. She need not be a resident of Canada and no special qualifications are required.

Status of Minors, Foundlings, Posthumous Births, etc.—Under Sect. 10 (5) of the Act, the Minister, in his discretion, may grant a special certificate of citizenship to a minor child of a person to whom a certificate of citizenship is, or has been, granted under the Act, on the application of that person if the person is the responsible parent, provided the child was born before the date of the grant of the certificate and has been admitted to Canada for permanent residence. Under Sect. 11 (3), the Minister may, in his discretion, grant a certificate to a minor in any special case whether or not the conditions required by the Act have been complied with. Every foundling, who is or was first found as a deserted infant in Canada, shall, until the contrary is proved, be deemed to have been born in Canada. Where a child is born after the death of his father, the child shall, for the purposes of definition of natural-born Canadian citizens, be deemed to have been born immediately before the death of the father.

Children of Diplomatic Representatives in Canada.—By the amendment of July 20, 1950 (effective Jan. 1, 1947), Sect. 5 (2) excludes from the status of natural-born Canadian citizens the children born in Canada of parents

who, at the time of the birth, are the diplomatic or consular representatives of foreign countries in Canada, or who are employees in the service of such representatives.

Adopted or Legitimated Persons.—Effective July 20, 1950, Sect. 11 (2) of the Act provides that certificates of Canadian citizenship may be granted to adopted or legitimated persons who have been admitted to Canada for permanent residence if the adopter, or the legally recognized father, is a Canadian citizen.

Certificate in Case of Doubt.—Under Sect. 11 (1) of the Act, a certificate may be granted for the purpose of removing any doubts as to whether the person to whom it is granted is a Canadian citizen, and it is specifically provided that the granting of the certificate shall not be deemed to establish that the person to whom it is granted was not previously a Canadian citizen.

Protection of Status Prior to the Canadian Citizenship Act.—Sect. 44 of the Act provides that, notwithstanding the repeal of the Naturalization Act and the Canadian Nationals Act, the Canadian Citizenship Act is not to be construed or interpreted as depriving any person who is a Canadian national, a British subject or an alien as defined in the said Acts, or in any other law in force in Canada, of the national status he possesses at the time of the coming into force of this Act.

Loss of Canadian Citizenship.—Canadian citizenship may be lost for the following reasons:—

(1) A Canadian citizen who, when outside of Canada and not under disability (minor, lunatic or idiot), acquires, by a voluntary and formal act other than marriage, the nationality or citizenship of a country other than Canada. This does not apply if that country is at war with Canada at the time of acquisition but, in such a case, the Minister may order that he cease to be a Canadian citizen. The purpose of this is to hold the person, if deemed necessary, to his obligations as a Canadian.

(2) A Canadian citizen who, under the law of another country, is a national or citizen of such country and who serves in the armed forces of such country when it is at war with Canada. This does not apply if the Canadian citizen became a national or citizen of such country when it was at war with Canada.

(3) A Canadian citizen who, when in Canada, acquires voluntarily the citizenship of a foreign country (other than by marriage), may be deprived of his Canadian citizenship by Order of the Governor in Council, on recommendation of the Minister.

(4) Under Sect. 18 of the Act, a Canadian citizen, other than natural-born or one who has served in the Armed Forces of Canada in time of war, who resides outside of Canada for six consecutive years without maintaining substantial connection with Canada, loses his citizenship automatically, but the period of absence may, upon application, be extended beyond the six years for good and sufficient cause. Sect. 18 is effective from Jan. 1, 1947, and will come into operation on Jan. 1, 1953.

Loss of Citizenship by Revocation—Applicable Only to Naturalized Persons.—

The citizenship of a Canadian citizen, other than a natural-born Canadian citizen, may be revoked by the Governor in Council for such reasons as trading or communicating with an enemy country during time of war; disaffection or disloyalty while out of Canada or who, while in Canada, has, by a court of competent jurisdiction, been convicted of any offence involving disaffection or disloyalty; obtaining a certificate of naturalization or Canadian citizenship by false representation or fraud; residence outside of Canada for not less than six years (without maintenance of substantial connection) since becoming a Canadian citizen or being naturalized in Canada; residence for not less than two years in a *foreign* country of which he was a national or citizen at any time prior to his becoming a Canadian citizen or being naturalized in Canada, and has not maintained substantial connection with Canada.

*Loss of Citizenship by Revocation—Applicable to Both Natural-Born and Naturalized Persons.—*The Governor in Council may, in his discretion, order that any person shall cease to be a Canadian citizen if, upon a report from the Minister of Citizenship and Immigration, he is satisfied that such person has, when not under a disability, (1) taken or made an oath, affirmation, or other declaration of allegiance to a foreign country, or (2) made a declaration renouncing his Canadian citizenship.

*Loss of Citizenship in Relation to Women.—*A female British subject who married an alien before Jan. 1, 1947, and upon marriage acquired her husband's alien nationality, ceased to be a British subject. If the husband was a British subject who became an alien during the course of the marriage and prior to Jan. 1, 1947, his wife became an alien if she acquired her husband's nationality.*

In the case of a marriage subsequent to Jan. 1, 1947, the woman, being a Canadian citizen, does not lose the status of a Canadian citizen unless, having on marriage acquired her husband's nationality, she makes a declaration renouncing her Canadian citizenship.†

Section 2.—Canadian Citizenship Statistics

In 1951, 20,937 Canadian citizenship certificates were issued, 20,423 in English and 514 in French. The corresponding figures for 1950 were 19,409 certificates, 18,923 in English and 486 in French.

During 1951, the Canadian Citizenship Registration Branch recorded 1,261 certificates of registration of births abroad, 8,653 declarations of intention filed with the courts, 91 declarations of retention of citizenship, and 49 declarations of resumption of Canadian citizenship. Certificates issued free to persons who had active military service numbered 591. Corresponding figures for 1950 were: 956 registrations of births abroad, 9,059 declarations of intention, 28 declarations of retention of citizenship, 3 declarations of resumption of citizenship and 764 certificates issued free to persons who had active military service.

* Persons in the above category were automatically restored to British nationality by the British Nationality Act, 1948.

† The foreign countries, under the laws of which a woman does not acquire the citizenship of such countries on marriage, are: Argentina, Brazil, Chile, Colombia, Ecuador, Guatemala, Morocco, Palestine, Panama, Paraguay and Uruguay.

NOTE.—*The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.*

The history of the collection of vital statistics in Canada is covered broadly at pp. 185-188 of the 1948-49 edition of the Year Book.

Unless otherwise specified, figures for Newfoundland, which entered Canadian Confederation on Mar. 31, 1949, have been incorporated where available in all tables for 1949 and 1950; where shown separately for the years prior to 1949, data have been taken from the Annual Reports of the Registrar General of Newfoundland. Available data for the Yukon and Northwest Territories are shown separately in Section 6, p. 220.

Numbers and rates of births and deaths are classified by place of residence and those for marriages by place of occurrence.

Section 1.—Summary of Vital Statistics

Tables 1 to 6 give a summary of the vital statistics of the provinces of Canada for the years 1941 to 1950.

In comparing the birth, death and marriage rates of the provinces, it is important to bear in mind that part of the differences observed may be due to differences in the sex and age distribution of their populations. Similarly, changes in these rates may be due partly to changes in this distribution. These remarks also apply to international comparisons of birth, death and marriage rates. For example, over the past 15 to 20 years, the crude death rate in British Columbia has been rising, while in Ontario it has been declining gradually with the result that, though 15 years ago the death rate in Ontario was considerably higher than in British Columbia, at present the situation is reversed. This does not mean, however, that the mortality rates at each age have risen in British Columbia. On the contrary,

* Revised in the Vital Statistics Section, Health and Welfare Division, Dominion Bureau of Statistics.

they have been falling. The death rate for the population as a whole has been rising since the increasing proportion of population in the higher age groups has more than outweighed the fall in the mortality rates at each age.

³ Excluding infants born alive but who died before

Canadian Births.—In Canada, the birth rate in 1921 was 29 per 1,000. Since a rate of 35 per 1,000 is very high for countries of modern western civilization, the Canadian birth rate had probably not fallen far or for long before then. It fell continuously until 1937, when it was 20 per 1,000 but since then, owing to economic recovery and the War, it rose to 22 in 1940, to 24 in 1943 and reached its highest point in 1947 at 28.6. The rate declined gradually since that year and stood at 27 in 1950. The birth rates in the provinces followed the same general trend, but in the Maritimes the fall stopped before 1930.

Sex of Live Births.—Wherever birth statistics have been collected, they have shown an excess of male over female births. No conclusive explanation of this excess has yet been given. Nevertheless it is so much of an accepted statistical fact that a proper ratio of male to female births has become one of the criteria of complete registration. The number of males to every 1,000 females born in Canada in 1941-50 varied between 1,067 and 1,051.

Hospitalization and medical attendance at birth have increased in Canada. In 1926-30, only 22 p.c. of live births occurred in hospital, while in 1940-42 the proportion was 50 p.c. and in 1950, 76 p.c. The provinces still differ greatly in this respect. In 1950 the proportions of births that occurred in hospital were: Quebec 47 p.c., New Brunswick 68 p.c., Prince Edward Island 84 p.c., Nova Scotia 85 p.c., Ontario 90 p.c., Manitoba 91 p.c., Saskatchewan 95 p.c., Alberta 96 p.c., and British Columbia 97 p.c.

Births in Urban Centres.—The figures of live births are classified according to the residence of the mother, and show the number of births, wherever occurring, to residents of each centre.

Illegitimacy.—Less than 4 p.c. of live births in Canada are illegitimate. This percentage is comparatively low; in the five-year period 1926-30 it was 3 p.c. and in 1941-45 it was just over 4 p.c. The apparent increase was due partly to the more complete registration of illegitimate births, brought about in large measure by the co-operation of provincial registration officials and social welfare agencies.

Stillbirths.—The rate of stillbirths has been falling since 1926, though not equally in all provinces. The rate of illegitimate stillbirths per 1,000 illegitimate live births is considerably higher than the rate of legitimate stillbirths, and consequently higher than the over-all rate.

Multiple Births.—Approximately one confinement in 85 in Canada results in the birth of more than one child. In the period 1926-50 there have been 78,017 such confinements, of which 77,303 were twins and 704 were triplets. There have been nine sets of quadruplets. The Dionne quintuplets were born in 1934.

The proportion of stillbirths is higher among multiple than among single births. It is about twice as high for twins and between three and five times as high for triplets.

Fertility Rates.—The sex and age distribution of the population is an important factor in determining birth, death and marriage rates. Since more than 95 p.c. of children are born to women between the ages of 15 and 50, differences in the proportion of women of these ages to the population as a whole will cause differences in the birth rates of different countries or regions, even though the fertility of women at each age may be the same. Measures of fertility which are independent of the sex and age distribution of the population have, therefore, been devised. The best known of these are age-specific fertility rates and reproduction rates.

Further details on this subject may be found at pp. 153-154 of the 1947 edition of the Year Book or from the D.B.S. report *Gross and Net Reproduction Rates, Canada and the Provinces*.

Ages of Parents.—Ages of the parents is an important variable in any analysis of birth statistics. The numerical and percentage distribution of legitimate live births by the ages of the parents is given in Table 13, of illegitimate live births by the age of the mother in Table 14, and of stillbirths by the age of the mother in Table 15, as well as the average ages of the parents for each year shown.

In 1930-32 the average age of fathers was 33·7 years and of mothers 29·3 years. The average age of parents is now slightly lower. Besides the fertility rates at each age, two other factors help, in the main, to determine the average age of parents having children: first, the average age of potential parents, at any point in time, that is, of the population between the ages of 15 and 50, and secondly, the proportions of first and second births to the total. The average age of men between 15 and 50 was 30·9 years in 1931 and 30·7 in 1941; the average age of women was 30·4 years in 1931 and again 30·4 in 1941. Thus the changes are very small. Other things being equal, a high proportion of first and second births will result in a lower average age of parents. In 1930-32 first and second births were 43 p.c. of the total births. By the period 1945-48 first and second births together were 57 p.c. of the total. These changes are very great and account for the lower average age of parents in recent years. However, in 1949 and 1950 the proportions of first and second births had declined to 54 and 53 p.c., respectively.

Tables 13, 14 and 15 illustrate other significant facts: that the average age of fathers of legitimate children is about four years greater than the average age of mothers; that the average age of mothers of illegitimate children is four to five years less than the average age of mothers of legitimate children—in 1930-32 the difference was six years (the fact that over 70 p.c. of illegitimate children are born to mothers under 25 years of age accounts for this difference); and that the average age of mothers of stillborn children is higher than that of the live born. Further, Table 15 shows that the rate of stillbirths per 1,000 live births increases with the age of the mother. It is almost three times as high among mothers of 40-44 years as it is among mothers at the ages of 20-24, and almost four times as high among mothers of 45-49 years.

Order of Birth.—Tables 16 and 17 show the order of birth of legitimate and illegitimate live-born children according to the age of the mother. In 1949 and 1950 the proportions of first-born children were 28 and 27 p.c., respectively, among legitimate live births, as compared with 30 p.c. in 1948, and 70 and 69 p.c., respectively, among illegitimate live births.

Birthplaces of Parents.—Table 18 shows the numbers and percentages of children whose parents were born in Canada and other countries. With increased immigration in recent years there are indications that the proportions of children born to foreign-born parents are increasing.

¹ These figures or percentages are of the children whose fathers and mothers were born in the same country. The difference between this figure and the total number of births represents the number of children whose parents were born in different countries.

Ethnic Origins of Parents.—A person's origin is usually traced through the father. For example, if the father is English and the mother French, the person's origin is said to be English. Illegitimate children, however, are usually classified by the origin of their mother, since the particulars of the father are seldom known.

Table 19 shows that about 60 p.c. of Canadian children are born to parents who are of the same ethnic origin.

Section 3.—Deaths

Declines in the death rate have been recorded in many countries during the past twenty years. Crude death rates should be used with caution in comparing the mortality levels of different populations, for they are affected by differences in the age composition of the population as well as by differences in the levels of mortality.

Subsection 1.—General Mortality

International Comparisons.—A comparison of the death rates in Canada and the provinces with those of other countries is shown in Table 20. It will be noted that the Canadian death rate is among the lowest in the world and that half the provinces have lower rates than most other countries.

20.—Death Rates per 1,000 Population of Various Countries compared with Canada and the Provinces, 1950

³ Registra-

Canadian Mortality.—Since 1931, the Canadian death rate has fluctuated between 10.3 and 9.3 per 1,000 of the population, declining slightly in recent years and reaching a record low of 9.0 in 1950. This decline has been apparent in all provinces but in varying degrees. The generally low rates in the Prairie Provinces are partly due to their younger average population while the relatively uniform rate in British Columbia is due to the increasing proportion of people in the older age groups.

Table 21 shows that throughout the provinces, with one exception (Prince Edward Island for 1948), the rates are higher for males than for females and that for Canada as a whole they are about 25 p.c. higher.

¹ Figures for Newfoundland are not included in these totals except for the years 1949 and 1950.

Deaths in Urban Centres.—In Table 22 deaths are classified by place of residence. The rates in urban centres vary only slightly from those of their respective provinces. However, due to the influx of young people from the rural areas, the age distribution of the population in urban centres is often more favourable to a low death rate than that of the province as a whole.

¹ As at the 1941 Census.

Sex and Age Distribution of Deaths.—Despite reductions in infant mortality, more deaths still occur in the first year of life than in any other single year. The number of children dying under five years of age was reduced from an average of 25,174 in 1930-32 to 17,949 in 1940-42. In 1949 and 1950 the numbers were 18,595 and 17,841, respectively, as compared with 17,899 in 1948. For both males and females the greatest number of deaths occur in the age group 70-79, the next highest being 60-69 years for males and 80-89 years for females.

The percentage distribution of deaths has changed greatly since 1930-32. The percentages of deaths at all ages up to 50 years have declined and the average age at death has gradually risen. The reduction in mortality rates in the early and middle years of life increases the number of people in the older age groups and will eventually raise the average age of the population as a whole. In 1931, 16.6 p.c. of the population was 50 years of age or over and the average age of all males was 29.0 years and of all females 28.1 years. In 1941, 19.7 p.c. of the population was 50 years of age or over, and the average age of all males had risen to 30.7 years and of all females to 30.2 years. The average age at death for males in 1926 was 40.0 years and for females 41.9 years; these have risen to 55.7 and 58.1, respectively, in 1950. Compared with most European countries, however, the population of Canada is still young.

Causes of Death.—Table 24 shows the deaths in Canada, grouped according to the International Abbreviated List of 50 causes. About 80 p.c. are due to the following groups of causes: diseases of the heart and arteries, cancer, accidents, diseases of early infancy, the respiratory diseases—tuberculosis, pneumonia and influenza—and nephritis.

The rise in the average age at death has been noted above. Causes of death that affect children and young adults mainly have declined. Diphtheria, for example, has been almost wiped out and tuberculosis has been greatly reduced. On the other hand, the ageing of the population increases the proportion of deaths from certain causes that affect older people. Thus, cancer and the diseases of the cardio-vascular-renal systems now account for a substantially larger proportion of all deaths than formerly.

24.—Deaths and Rates per 100,000 Population, according to the International Abbreviated List of 50 Causes, by Provinces, 1950

NOTE.—Deaths for 1950 were classified according to the 1948 (6th) Revision of the International List of Causes of Death, while those for previous years were classified according to earlier revisions of the List. The cause groups shown below are therefore not strictly comparable with those shown in previous issues of the Year Book.

Subsection 2.—Infant Mortality

International Comparisons.—The completeness of registration of live births and infant deaths varies from country to country and there is some evidence that the under-registration of deaths is proportionately greater for infants than for other ages. The reliability of the basic data should, therefore, be kept in mind when comparing the rates.

25.—Infant Mortality per 1,000 Live Births in Various Countries compared with Canada and the Provinces, 1950

(Source: *Monthly Bulletin of Statistics of the United Nations* and other official publications. In certain cases final figures are not available and provisional data are used.)

Canadian Infant Mortality.—A striking improvement has been shown in the rate of infant mortality during the past 25 years. Of the children born in 1946-50, approximately 87,000 lived to their first birthday who would have died at the rate prevailing in the period 1926-30.

Infant mortality of males is 25 to 30 p.c. higher than that of females for Canada as a whole, with wider variations for the individual provinces. It was pointed out earlier that there were between 1,051 and 1,067 males born to every 1,000 females. Because male infant mortality is higher, the excess of males is reduced drastically by the end of the first year. For example, in 1940-42, 397,038 male children were born, compared with 374,908 female children, an excess of 22,130 or 5.9 p.c.; 25,024 male children died during their first year compared with 18,646 female children, that is 6,378 more. The excess of males at one year of age is thus reduced to 15,752, or 4.4 p.c.

Infant mortality rates vary considerably from province to province. One of the principal causes of these variations appears to be the different proportions of births which take place in hospital or under proper medical care, as pointed out earlier on p. 186. Along with increased hospitalization has come better and more widespread pre-natal and post-natal care. Other factors, particularly the supervision of water supplies, improved sanitation and the pasteurization of milk, also have been important.

¹ Figures for Newfoundland are not included in these totals except for the years 1949 and 1950.

Infant Mortality in Urban Centres.—Because of the relatively small numbers of infant deaths in individual cities and towns the rates for these centres usually vary widely from year to year. As is evident from Table 27, many cities and towns have, however, maintained consistently low rates as compared with the national rate or the rates for the province in which they are situated.

Causes of Infant Deaths.—Of the 15,324 infant deaths in 1950 almost 15 p.c. were due to immaturity; 12 p.c. to congenital malformations; over 11 p.c. to pneumonia among infants over 4 weeks of age and over 10 p.c. were due to injury at birth. These specific causes accounted for almost one-half of the total infant deaths.

28.—Infant Mortality and Rates per 100,000 Live Births, by Selected Causes and by Provinces, 1950

Note.—Deaths for 1950 were classified according to the 1948 (6th) Revision of the International List of Causes of Death, while those for previous years were classified according to earlier revisions of the List. The cause groups shown below are, therefore, not strictly comparable with those shown in previous issues of the Year Book.

Subsection 3.—Maternal Mortality

The number of mothers who die in pregnancy and childbirth has been greatly reduced in recent years. Maternal mortality in Canada and the provinces is shown in Table 5, p. 184. Although the number of births has been much greater in recent years, the number of maternal deaths has declined steadily since about 1930 (when there were 1,405 deaths and a rate of almost six deaths for every 1,000 live births) to 420 in 1950. Since 1945 the rate of maternal mortality has dropped below two per 1,000 live births and was just over one per 1,000 live births in 1950. Mortality among unmarried mothers is higher than among married mothers.

Age at Death.—Table 29 shows the distribution of maternal deaths by age, together with the average age at death. The latter is slightly more than two years higher than the average age of all mothers at the time of childbirth. The rates per 1,000 live births by age groups show that age is a most important factor in maternal mortality. Though all the rates are much lower than they used to be, the inequalities between the age groups remain. The rate at 30-34 years is over twice as high as the rate at 20-24 years, and at 40-44 years it is over six times as high. The higher rate in the first age group shown in the table, compared with the second, is due to the high proportion of illegitimate children born to young mothers.

Causes of Maternal Deaths.—Table 30 shows, by causes, the numbers and rates of maternal deaths per 100,000 live births. Until a decade ago, puerperal sepsis and toxæmias of pregnancy were by far the most important causes. Since 1936 the rate for puerperal sepsis has been reduced by almost 95 p.c. due in large measure to the use of sulpha and other antibiotics. Although there has been a reduction of over 70 p.c. since 1936 in the maternal death rate from toxæmias of pregnancy, this still remains the second major cause of maternal deaths, after complications of delivery.

30.—Maternal Mortality and Rates per 100,000 Live Births, by Causes and by Provinces, 1950

NOTE.—Deaths for 1950 were classified according to the 1948 (6th) Revision of the International List of Causes of Death, while those for previous years were classified according to earlier revisions of the List. The cause groups shown below are, therefore, not strictly comparable with those shown in previous issues of the Year Book.

Section 4.—Natural Increase

In 1926-30 the rate of natural increase in Canada (excess of births over deaths) was 13 per 1,000 population. Owing partly to the depression, the birth rate declined more than the death rate and the rate of natural increase fell to 9.7 in 1937. Since then the rate has increased to 12.6 in 1940-42, 14.5 in 1945, 17.5 in 1946 and 19.2 in 1947. The rates of 17.7 in 1948, 17.9 in 1949 and 18.1 in 1950 were lower due to increases in total deaths in recent years.

The rates of natural increase in the provinces followed generally the rate for Canada as a whole. In earlier years, Saskatchewan and Quebec had the highest rates. The high rates in all the Prairie Provinces were due partly to their relatively younger populations and consequent low death rates. In Quebec, on the other hand, the death rate in 1926-30 was high; it has declined steadily since. Due to high birth rates, Newfoundland and New Brunswick have had the highest rates of natural increase in Canada in recent years.

The rates are generally higher for females than for males for the reason that death rates for males are higher than for females. In the western provinces particularly, the fact that the ratio of males to females in the total population is higher than in other parts of Canada makes for a lower rate of natural increase.

In a country such as Canada with a fairly young population and where immigration has been large, an excess of males is to be expected but the higher rate of natural increase for females will gradually reduce this excess. The trend is towards an eventual excess of females in the total population as there now is in most European countries.

¹ 1949.

As a rule, marriage rates vary with the level of economic prosperity. They fell during the depression years following 1929, but recovered in the later 1930's. In Canada, England and the United States, the number of marriages was exceptionally high in 1940-42, decreased in 1943 and 1944 but increased in 1945 and 1946, and reached peak rates in the immediate post-war years. The Canadian post-war peak marriage rate of 10.9 was reached in 1946.

Canadian Marriages.—Table 34 shows the number of marriages and the marriage rates per 1,000 population in Canada and the provinces. Percentages of brides and bridegrooms, according to place of birth, are also given.

For the country as a whole, about 85 p.c. of the grooms were born in Canada—70 p.c. in the province in which they were married. Almost 90 p.c. of the brides were born in Canada—over 75 p.c. in the province in which they were married. However, there are wide variations from this pattern as between provinces; in the four Atlantic Provinces and Quebec there is a greater tendency to marry native and/or province-born partners than in the other provinces.

34.—Marriages and Marriage Rates, by Provinces, with Percentage Distribution of Bridegrooms and Brides by Nativity, 1947-50

Age and Marital Status of Bridegrooms and Brides.—Over 91 p.c. of the marriages in 1950 were between persons who had not previously been married; 5 p.c. of the brides and grooms had been widowed, while almost 4 p.c. of the marriages were of divorced persons. The average age at marriage of bachelors is about 27 years and that of spinsters about 24 years. The average age of widowers and widows at the time of re-marriage is almost double that of bachelors and spinsters. Nine out of ten spinsters married in 1950 were less than 30 years of age—7 out of 10 below 25 years—while 8 out of 10 bachelors were less than 30 and about one-half of the total were below 25 years of age.

¹ Exclusive of Newfoundland.

Religious Denominations of Brides and Bridegrooms.—The distribution of brides and bridegrooms by religious denominations is roughly the same as that for the population as a whole. Table 37 shows the very strong influence that religion has on marriage. About 70 p.c. of all marriages are between persons of the same religious denomination; among those of Jewish faith, it was 95 p.c. in 1950; among Roman Catholics 89 p.c.; United Church 62 p.c.; and Eastern Orthodox 59 p.c.

¹ Includes Greek Catholic. ² Exclusive of Newfoundland.

³ Percentage of marriages between contracting parties of the same religious denomination.

Subsection 2.—Dissolutions of Marriage (Divorces)

For many years after Confederation, the number of divorces granted in Canada were few. There were less than 20 divorces in every year before 1900, 23 in 1903, 31 in 1909 and 60 in 1913. These numbers represent less than one per 1,000 of the early number of marriages.

The end of World War I in 1918 saw an increase in the number of divorces. The generally unsettled conditions and the long separation between men on Active Service and their wives may have contributed to this increase. Changes in law and procedure may also have been a further factor—at present, Quebec and Newfoundland are the only provinces in which applicants for divorce must secure a private Act of Parliament. The number of divorces had increased to 114 in 1918; 608 in

1926; 700 in 1931; 1,570 in 1936; and 2,369 in 1940. From 1940, the numbers increased annually to a peak of 8,199 in 1947, declining gradually since that year until in 1950 they were 5,373 or 34 p.c. lower than in 1947.

¹ Exclusive of the Territories.

² By a new rule adopted in August 1948, a *Decree Nisi* became absolute at the end of three months. As a result, a number of divorces did not become effective until the following year.

Section 6.—Vital Statistics of the Yukon and Northwest Territories

The vital statistics of the Yukon and Northwest Territories have been collected since 1924. These statistics are not presented with those of the ten provinces in the tables of this Chapter, because the figures are not considered complete in that the personal particulars in many cases are not available, and the small and varying population of each year is not accurately known.

39.—Vital Statistics of the Yukon and Northwest Territories, 1941-50, with Five-Year Averages, 1926-40

NOTE.—Figures for 1944 to 1950 are by place of residence; for previous years by place of occurrence.

Section 7.—Canadian Life Tables

Two official life tables for Canada and regions have been published: the first was calculated on the basis of the deaths of 1930-32 and the census population of 1931; the second on the basis of the deaths of 1940-42 and the census population of 1941. In addition, tables have been computed for Canada as a whole for the

years 1945 and 1947 based on estimated populations by sex and age and the deaths recorded as having occurred during those years. The life table for 1947 is given in abbreviated form in Table 40.

40.—Canadian Life Table, 1947

Life tables give a summary of the health and general conditions of survival of the population in a conventional, standard form. A hypothetical number (100,000) of births of each sex is assumed. The life tables show how, on the basis of the mortality rates at each age in the given years, these 100,000 of each sex are reduced in number by death. For example, during the year 1947, of 100,000 males born, 5,198 died in their first year, so that 94,802 survived to one year of age; 408 died in their second year, so that 94,394 survived to two years of age; and so on. At 100 years of age,

only 56 of the original 100,000 would have survived. The probability of death at each age is the ratio between the number of deaths and the population at each age. Finally, the expectation of life is the average number of years which a person might expect to live if the mortality rates in the given years remained constant.

Mortality rates for males are higher at all ages than for females, particularly in infancy. Infant mortality in 1940-42 was 62 per 1,000 live births for males compared to 49 per 1,000 for females. Because infant mortality is still so high, the expectation of life at birth is less for both sexes than at age one. In 1947 males who had survived their first year had an expectation of life of almost 68 years and females of almost 71 years. The expectation of life of a boy at age 15 was 55 years, and of a girl 58 years. At age 25, it was about 46 years for men and almost 49 for women. At age 70, it was 10.4 years for men and 11.4 years for women.

Table 41 summarizes the life expectancy figures for 1931, 1941 and 1947. During this period, life expectancy at birth increased from 60 to over 65 years for males and from 62 to 69 years for females. The greatest increases were among the younger ages for both sexes but were appreciably higher among females than among males and for females extended into the older ages. There was little or no appreciable increase between 1931 and 1947 in life expectancy among males over 40, whereas for females the rates increased at all ages up to 80. Increases in life expectancy among women of child-bearing age are worthy of note.

41.—Expectation of Life, 1931, 1941 and 1947

Section 8.—Communicable Diseases

The national reporting of communicable diseases in Canada was undertaken in 1933 by the Dominion Bureau of Statistics, at the request of the Federal Department of Pensions and National Health in co-operation with the Provincial Departments of Health. Since then, the Health and Welfare Division of the Bureau has been responsible for the weekly compilation and analysis of communicable diseases except for a short period during 1939-40, when the work was transferred to the Department

of Pensions and National Health. The reports of cases of venereal diseases are included in the current analyses and a standard report form is used by all the provinces.

Table 42 indicates the relative number of cases of certain communicable diseases reported to the Dominion Bureau of Statistics by the Provincial Departments of Health in 1950. The reporting of two diseases, dysentery and rubella, is not compulsory in all provinces and the totals for Canada should, therefore, be accepted with reservations.

THE DEVELOPMENT OF PUBLIC HEALTH, WELFARE AND SOCIAL SECURITY IN CANADA*

Evolution of Provincial and Municipal Administration.—Public health and welfare, traditionally and constitutionally, have been regarded as matters primarily for provincial and municipal action. While the British North America Act does not clearly or specifically refer to public welfare or social security, the references therein to such matters as eleemosynary institutions, hospitals, asylums, public charities, etc., have fixed in the minds of most authorities the principle that, under the Canadian constitution, the provinces rather than the federal authorities have constitutional responsibility in the health and welfare field. The Federal Government, however, is specifically assigned jurisdiction over "quarantine and the establishment of marine hospitals".

Many of the earliest welfare undertakings were initiated not by provincial or municipal governments, but by voluntary organizations led by public-spirited citizens. It was voluntary citizen initiative in most of the early Canadian communities that led to the establishment of orphanages, hospitals, homes for the

* Contributed by Dr. G. F. Davidson, Deputy Minister of Welfare, Department of National Health and Welfare.

aged, other institutions, and health and welfare agencies working within the homes of families to bring help and assistance where needed. As the worth of these programs was proved and as the financial burden of carrying them became too great for private philanthropy, municipal governments, first of all, responded to appeals for help by granting financial assistance without assuming administrative responsibility. Gradually, however, as municipal financial involvement became greater, the necessity for taking over certain of these undertakings as direct administrative responsibilities of the municipal authorities became apparent, and municipalities found themselves in the business of providing public health and welfare services at public expense for the citizens of their respective communities.

This process by which financial and subsequently administrative responsibility for certain health and welfare services was imperceptibly shifted from voluntary to municipal auspices repeated itself, as time went on, at the municipal-provincial level. Prior to the outbreak of World War I, welfare services were provided almost exclusively by local voluntary agencies and by the municipal authorities. Beginning, however, with the enactment of the first Workmen's Compensation Act in Ontario in 1914, there followed a series of interventions by provincial governments in the public welfare and social security field, which established during the years between the two world wars a clear pattern of provincial responsibility for providing direct social services in some instances and assisting municipalities in other instances in the provision of local public welfare programs. A number of other provincial governments quickly followed Ontario's lead with respect to workmen's compensation. Coincident with the granting of the women's suffrage, the Manitoba Government in 1916 passed the first mothers' allowances legislation. Once again this was followed by similar legislation in a number of other provinces.

Each provincial enactment, whether in the form of workmen's compensation legislation, mothers' allowances, child protection legislation or laws providing for the establishment of juvenile courts and juvenile reform institutions, added successively to the predominance of provincial government authority in the social welfare field; and as the legislative, administrative, supervisory and financial responsibilities of the provincial governments increased, such responsibilities carried by the municipalities correspondingly diminished.

Provincial responsibility in the health field was recognized at an early date. The duties specifically assigned by the British North America Act, together with the residual powers generally accepted under interpretations of the "property and civil rights" clause of Sect. 92, stimulated this development. A Department of Public Health, succeeding an earlier Central Board of Health, was created by the Assembly of Nova Scotia in 1904 and several provinces followed the example of the Public Health Act of New Brunswick of 1918 which created a full-time Cabinet post for such a Department. A similar growth in the welfare field was to take place in the late 1930's and early 1940's, with the establishment of separate Departments of Welfare or the enlargement of the existing Departments of Health to embrace both health and welfare.

Development of Federal Responsibility.—During the years of World War I and the following decade, there was little or no indication of public support for the intervention of the Federal Government in what appeared to be normal peacetime provincial and local areas of responsibility. In the aftermath of World War I, the federal authority found itself committed to an extensive program of health and welfare services for discharged and pensionable ex-service men. In this and in a

number of other specialized fields, the Federal Government slowly began to acquire a certain familiarity with the nature of the problems involved, although there was little thought at the time, either in the minds of governments or on the part of the public generally, that the federal authority had any proper responsibility in this field.

The year 1919 is significant since it marks the establishment of a Federal Department of Health, whose functions included quarantine and immigration medical services, narcotic control, food and drug standards, child welfare, housing and the supervision of a venereal disease control grant. Beginning with the year ended Mar. 31, 1920, with the exception of a few years in the 1930's, money from this grant was available to assist the provinces in the establishment and operation of a series of venereal disease clinics. In 1928, the Departments of Health and Soldiers' Civil Re-establishment were merged.

Not until 1927, however, did the Federal Government enter into a commitment in the field of public welfare which could be regarded as continuous or permanent. Here again, the pattern that had manifested itself with regard to the voluntary and municipal agencies in the first instance, and later with the municipal and provincial governments, repeated itself in the area of provincial-federal relationships.

Recognizing that the costs of providing old age pensions on a means-test basis for persons 70 years of age or over were too great to be borne by the provincial governments alone, the Federal Government passed the Old Age Pensions Act in 1927 authorizing federal tax funds to be made available to reimburse provincial governments for 50 p.c. of the costs of old age pensions paid in conformity with standards laid down in federal legislation. In taking this step, the federal authority entered the field of public welfare and social security legislation for the first time on a continuing basis. Just as the year 1914 marked an important point of transition in the shift of the burden of administrative and financial responsibility for public social services from the municipal to the provincial level, so the year 1927 was significant as the beginning of a new phase in which, slowly at first but in later years with gathering momentum, the financial and administrative responsibility for public social services shifted from provincial governments to the Federal Government.

For a decade or more following the first significant step in 1927 the trend was slow to develop. The position taken by the Federal Government was that public welfare services, under the constitution, were the exclusive responsibility of the provinces and that, while federal financial assistance might be made available to help in carrying the burden, the basic financial and administrative responsibility rested with the provinces. It was on this basis that the old age pension plan of 1927 was conceived and carried out. It was likewise on this basis that the unemployment relief program during the depression years was undertaken, with all three levels of government sharing in the financial responsibility, but with most of the administrative responsibility resting on the provincial and local authorities.

During these years the provincial governments began to protest the thesis that responsibility for large-scale social services should be carried by the provincial authorities. They pointed out that problems of such magnitude could be dealt with satisfactorily only by that governmental jurisdiction which had the broadest and most extensive taxing powers, namely, the Federal Government. Strong pressures developed on the provincial and municipal levels to have the Federal Government take over responsibility for unemployment relief. This trend, running counter to the normal provincial concern regarding federal encroachment in provincial

fields, led in 1940 to the constitutional amendment of the British North America Act which made it possible for the Federal Government to enact unemployment insurance legislation. The Unemployment Insurance Act of 1940 was the first in a series of steps taken by which the Federal Government has been committed to a continuing responsibility for a number of major programs in the public welfare and social security fields. Provincial expenditures for health services, however, continue to exceed those of the Federal Government despite the increased federal commitments under the National Health Grants commencing in 1948.

Responding to the development of public opinion in favour of a larger measure of social security, the Federal Government has assumed direct administrative as well as financial responsibility for specific social security programs. One example of this was, of course, unemployment insurance, already mentioned, but more significant still was the enactment of the Family Allowances Act of 1944 whereby the Federal Government entered the social security field on a large scale. Under this Act, monthly allowances are paid for 4,500,000 children under 16 years of age at a yearly cost now running in excess of \$330,000,000. By this Act, and by the establishment at the same session of Parliament of a Department of National Health and Welfare, the Federal Government made it clear that it was prepared to accept a continuing responsibility for developing and carrying out a health, social security and social welfare policy on broad lines for the benefit and protection of the Canadian people.*

Through the establishment, both on provincial and on federal levels, of organized departments of public welfare, the machinery now exists for co-operative and integrated planning of national and provincial social welfare services. While the outlines are not yet clear as to the respective roles of the provincial governments and the Federal Government, the creation of these departments has combined to give the development of public social services a tremendous impetus during the past decade.

Current Social Security Program.—Through the enactment of unemployment insurance in 1940, the passage of the Family Allowances Act of 1944, the creation of the Department of National Health and Welfare in the same year, the passage of improved and extended veterans legislation during the later war and the post-war years, the inauguration of the national health program in 1948, and finally through the enactment in 1951 of the Old Age Security Act, the Old Age Assistance Act and the Blind Persons Act, the Federal Government has established on the national level the broad framework of a social security program which, while yet incomplete, has the elements of an organized and planned social security development.

While municipal and provincial governments still carry heavy responsibilities in the public welfare field, the administrative and financial responsibilities assumed by the federal authority have greatly outstripped these in the past few years. Further information is provided in the Sections that follow concerning the various activities and programs.

Expenditures on Health, Welfare and Social Security.—Governmental expenditures in the fields of health, welfare and social security are now larger than expenditures for any other peacetime purpose and rank second only to expenditures for national defence. While definitions may vary as to what should or should

* The Department of National Health and Welfare Act (8 Geo. VI, c. 22, Sect. 5) states, in part: "The duties, powers and functions of the Minister shall extend to and include all matters relating to the promotion or preservation of the health, social security and social welfare of the people of Canada over which the Parliament of Canada has jurisdiction".

not be included in any tabulation of health, welfare or social security expenditures, it may safely be estimated that the total of federal, provincial and municipal expenditures in these fields stands currently at not less than \$1,300,000,000 annually. Under some tabulations, in fact, the figure is shown to be as high as \$1,500,000,000 annually. Expressed in another way, health, welfare and social security expenditures in 1952 will amount to not less than 20 p.c. of total expenditures made by all governments—federal, provincial and municipal.

These formidable figures of current expenditure contrast sharply with the modest amounts expended only a generation ago for the same purposes. In 1871, four years after Confederation, Canada, with a population of approximately 3,700,000, spent around \$1,000,000 on public health and welfare programs. This amount had risen to not more than \$15,000,000 in 1913 when the population numbered about 7,530,000. Even allowing for the fact that present population exceeds 14,000,000 and that price levels have risen with the post-war inflation, current amounts spent are still striking. They are evidence of the increased importance which governments generally have attached to meeting the social needs of the people.

Expenditures under the 1951 Legislation on Old Age Security, Old Age Assistance and Blind Persons' Allowances.—The inauguration of the new old age security program at the beginning of 1952 added almost \$225,000,000 annually to the Federal Government's continuing commitments in the field of social security. Annual costs under the Old Age Security Act, by which monthly pensions of \$40 are provided free of means-test to all persons over the age of 70 with 20 years' residence in Canada, are expected to commence at a level around \$320,000,000 annually—about the same as for family allowances. Within a few years, however, because of the rapidly ageing population, expenditures under the Old Age Security Act are expected to outstrip family allowance expenditures, thus making the old age security program Canada's most expensive social security undertaking.

In addition to payments under the Old Age Security Act to persons over the age of 70, provision was also made beginning Jan. 1, 1952, under the Old Age Assistance Act, for sharing with provincial governments the cost of old age assistance payments provided on the basis of need to persons between the ages of 65 and 69. Costs under this program, shared on a fifty-fifty basis by the Federal Government and the provinces, are expected to reach a level of \$40,000,000 in the first year of operation, and to rise in a relatively short time to an annual expenditure of \$60,000,000 or more.

The third related legislative development which took effect at the beginning of 1952 was the passage of the Blind Persons Act under which provision is made for continuing the cash assistance, previously paid under joint federal-provincial auspices to blind persons through the Old Age Pensions Act, on an extended and somewhat more generous basis and related exclusively to the needs of the blind. Under the new Blind Persons Act the Federal Government will reimburse the provinces for 75 p.c. of the cost of blindness allowances paid to eligible blind persons between the ages of 21 and 69. Allowances under this legislation are paid on the basis of need, the maximum amount payable being \$40 monthly as in the case of old age assistance and old age security. Blind persons reaching the age of 70 give up the allowances received under this legislation and become eligible for the old age security benefit on a basis free of the means-test.

While more generous conditions of eligibility have been established for the blindness allowances due to more generous means-testing and a reduction in the residence requirement from 20 years to 10 years, expenditures under the Blind Persons Act are expected to be smaller than expenditures formerly made for pensions to the blind under the Old Age Pensions Act. The reason for this is, of course, that blind persons 70 years of age or over are not carried as charges under the Blind Persons Act but are transferred to the new Old Age Security Act. In consequence, annual expenditures under the Blind Persons Act for means-test allowances to blind persons between the ages of 21 and 69 are expected to run between \$3,000,000 and \$4,000,000 annually, 75 p.c. of this cost being reimbursed to the provinces by the Federal Government.

In summary, annual expenditures under these three new enactments are expected to be not less than \$364,000,000 in the first year of operation and to rise steadily in subsequent years. Not all of this, of course, is additional expenditure, since the Old Age Security Act, the Old Age Assistance Act and the Blind Persons Act absorb among them the total expenditure formerly made under the Old Age Pensions Act. A comparison of the expenditures formerly made under the Old Age Pensions Act with respect to aged and blind persons with the expenditures anticipated under the new legislation is shown in the following table.

1.—Expenditures for 1951 and 1952 under Old Age Security Act, 1951, Old Age Assistance Act, 1951, Blind Persons Act, 1951, and Old Age Pensions Act, 1927

(Millions of dollars)

PART I.—PUBLIC HEALTH*

The planning, supervising and financing of public health and medical care services in Canada rest mainly with the provinces while the actual administration of services is conducted, in most provinces, by municipal and other local authorities. The Federal Government provides consultative and specialist services, assists in the financing of provincial health activities through the National Health Program and maintains, as well, services for special groups such as veterans and Indians. The functions of the Federal Government are described in Section 1, provincial and municipal health activities are reviewed in Section 2, and institutional statistics are given in Section 3.

* Sections 1 and 2 of this Part were prepared by the Research Division, Department of National Health and Welfare, Ottawa.

Section 1.—Federal Health Activities

Federal participation in health matters is largely centred in the Department of National Health and Welfare, with certain important programs being administered by: the Department of Veterans Affairs, which provides medical and hospital care to veterans chiefly for disabilities resulting from war service (*see* Part IV of this Chapter); the Department of National Defence, which is responsible for the health of the Armed Forces; the Medical Division of the National Research Council, which administers grants for medical research; and the Dominion Bureau of Statistics, which undertakes the collection and compilation of health statistics. The Department of Agriculture has certain responsibilities in connection with food production.

Under the Department of National Health and Welfare Act of 1944, the Department is responsible for the administration of certain statutes, for research in health matters, for the carrying out of international health obligations undertaken by Canada and, in co-operation with the provinces, for the preservation and improvement of public health.

Under the Quarantine Act, the Department maintains a maritime and aerial navigation quarantine service to exclude infectious diseases. It advises on the administration of sections of the Immigration Act dealing with health and conducts, in Canada and overseas, the medical examination of applicants for immigration; provides care for sick mariners as required under Part V of the Canada Shipping Act; and has certain national and international responsibilities with regard to the pollution of boundary and other waters.

Under the Food and Drugs Act, the Proprietary or Patent Medicine Act and the Opium and Narcotic Drug Act, the Department is responsible for the control of the quality of food and drugs, the registration, preparation and sale of proprietary or patent medicines, and control of the import, export and distribution of narcotic drugs.

The Department passes on the visual eligibility of applicants for blind person allowances and co-operates with the provinces in the provision of remedial services for recipients of these allowances; it is responsible for supervision of health conditions for persons engaged on federal public works, as provided under the Public Works Health Act, and maintains a program for the conservation and promotion of the health of civil servants and other Federal Government employees. Medical advisory services are provided to the Department of Transport in all matters pertaining to the safety, health and comfort of air crew and passengers.

The National Health Program.—The National Health Program, which was announced in May 1948, provides for the payment of federal grants to the provinces. The provision of these grants represented the first stage in the development of a comprehensive health insurance plan for all Canada. The program has three basic purposes: to assist the provinces in surveying their health facilities and services; to assume part of the cost of new hospital construction over a period of years; and to make annual grants to improve and strengthen provincial services in particular health fields.

Since the inception of the program the provinces have steadily increased their utilization of the grants for the development of all types of provincial health services. In the first year (ended Mar. 31, 1949) the provinces spent 25.8 p.c. of the funds

available under all grants except the Health Survey Grant, in 1950-51 expenditures amounted to 53.1 p.c. of the funds available and in 1951-52, 68.9 p.c. was spent. Total expenditures, by type of grant, from May 1948 to Mar. 31, 1952, together with amounts spent for the year ended Mar. 31, 1952, were as follows:—

<i>Type of Grant</i>	<i>May 1948 to Mar. 31, 1952</i>	<i>Expenditures for Year Ended Mar. 31, 1952</i>
	\$'000	\$'000
Crippled children.....	885	350
Professional training.....	1,587	521
Hospital construction.....	26,090	9,166
Venereal disease control.....	1,782	480
Mental health.....	8,737	3,724
Tuberculosis control.....	12,225	4,046
Public health research.....	736	314
General public health.....	9,375	3,605
Cancer control.....	5,737	2,042
Health surveys.....	493	73
TOTALS.....	67,647	24,321

By December 1951, surveys of existing health facilities had been undertaken in all provinces, accommodation for about 35,000 new hospital beds had been approved for construction and approximately 3,300 health workers had received or were undergoing special training. The provision of the federal grants made possible the employment in 1951 of over 4,300 additional health workers across the country. Provincial and municipal health facilities had been aided by the purchase of additional technical equipment and by the extension of both preventive and treatment services and a significant increase in health research had been made possible.

Federal Grants to Non-Governmental Organizations.—Grants are paid to the following non-governmental agencies engaged in health work: the Canadian Red Cross Society, the Canadian Tuberculosis Association, the Victorian Order of Nurses, the St. John Ambulance Association, the Canadian Paraplegic Association, the Canadian Mental Health Association, the Health League of Canada, the Canadian Public Health Association, the Canadian National Institute for the Blind, L'Association Canadienne-Française des Aveugles, L'Institut Nazareth de Montréal and the Montreal Association for the Blind.

Medical Care of Indians and Eskimos.—Health services for Indians and Eskimos are administered by the Department of National Health and Welfare. In 1951, 18 hospitals, 29 nursing stations, and 49 other health centres were operated by the Department which also reimburses, on a per diem basis, the mission and other non-federal hospitals which provide accommodation for Indians and Eskimos. Full-time departmental medical officers serve the larger Indian reserves and part-time officers serve the smaller bands. In addition, in some cases, fees are paid to local physicians for services to Indians.

Consultative and Co-ordinating Services.—The principal co-ordinating agency in the health field in Canada is the Dominion Council of Health, which is composed of the Deputy Minister of National Health who serves as Chairman, the Chief Health Officer of each province and five other persons. The Council advises the Minister of National Health and Welfare on the formulation of policy.

It is largely responsible for the development of a co-operative health program and for the establishment of services by the Federal Government to assist the Provincial Health Departments. Federal-provincial committees of the Council deal with specific aspects of public health.

Certain Divisions of the Department provide technical information and advice and, independently and in co-operation with other departments and agencies, conduct surveys in research and development, the evaluation of programs and procedures, and the establishment of standards. These Divisions include Blindness Control, Child and Maternal Health, Industrial Health, Nutrition, Mental Health, Dental Health, Epidemiology, Hospital Design, the Laboratory of Hygiene, Information Services, and Research.

Section 2.—Provincial and Municipal Health Activities

Health services are administered in different ways in the various provinces, but provincial functions commonly include central planning and administration; the operation of special programs affecting the entire province in such fields as cancer, mental health, tuberculosis and laboratories; consultant service to local authorities; the administration of regulations governing local services; the provision of basic services in areas without municipal organization; and participation in the work of local health units in areas where that type of administration has been developed.

At the local level, responsibility for services varies widely, but municipalities in most provinces provide a range of basic public health services and participate in the costs of hospital care for indigents. In recent years there has been a rapid growth of health services in smaller centres and rural areas through the organization of health units with full-time staff serving counties or other combinations of local government areas. This type of organization, which concentrates on a generalized health program that includes public health nursing, sanitary inspection, communicable disease control, child, maternal and school hygiene and health education, is characteristic of most provinces; financial and administrative responsibility is shared by the provincial and local authorities involved. In spite of a trend towards greater provincial participation in these local units, many remain under local administration as do the highly developed health departments found in the larger cities. Outside of fully organized health-unit areas, municipalities usually appoint part-time medical officers and other personnel while the provincial authorities assume responsibility in the areas lacking municipal organization.

Newfoundland.—Health measures in Newfoundland are centrally administered by a Department of Health. Its main functions include the operation of tuberculosis, communicable disease and venereal disease control programs, nutrition and sanitary inspection services, and the provision on a prepayment basis of medical, hospital and nursing care in certain regions.

The Provincial Tuberculosis Dispensary at St. John's provides free diagnostic and treatment services and acts as the centre for tuberculosis control. The Province subsidizes separate tuberculosis control programs conducted in the northern areas by the International Grenfell Association and the Notre Dame Bay Memorial Hospital, and assists the Newfoundland Tuberculosis Association, which maintains a sea-borne X-ray unit, with surveys in other areas.

Free treatment services and drugs for venereal disease are available throughout the Province through full-time and part-time district medical health officers and public health nurses. A school health program includes educational work and such activities as the distribution of chocolate milk-powder and cod-liver oil.

The Department operates a general hospital, a tuberculosis sanatorium and a hospital for mental and nervous diseases all at St. John's and has recently opened a new provincial sanatorium at Corner Brook. Privately operated hospitals receive per diem payments for departmental cases and, in certain outlying areas, substantial provincial grants.

The "cottage hospital" scheme operates on a prepayment basis and is designed to provide medical and hospital service to the population of outlying areas. Services are provided through 17 small provincially operated hospitals with a total capacity of about 450 beds and equipped in most cases with laboratory and X-ray services. Medical officers and nursing stations in adjoining communities supplement these services. Prepayment of \$10 annually for the head of each family and \$5 annually for each single adult, entitle subscribers to outpatient diagnosis and treatment, to home visits by the doctor and to hospitalization, as required, in the cottage hospitals or, when necessary, in the general hospital at St. John's or outside the Province. Hospitalization for maternity is provided only in complicated cases. In districts not served by doctors, nursing services are provided on payment of an annual fee of \$6 for a family or \$3 for a single person. In general, the cost of medical and hospital care for indigents is borne by the Province, but some social aid recipients pay premiums in cottage hospital areas.

Prince Edward Island.—The Health Branch of the Department of Health and Welfare includes Divisions of Public Health Nursing, Sanitary Engineering, Dental Health, Laboratories, Venereal Disease Control, Cancer Control, Tuberculosis Control, Mental Health and Vital Statistics.

Generalized public health nursing services are conducted by seven district nurses, and sanitary services are provided under the direction of a public health engineer. Free dental treatment is available for needy children at a permanent clinic at Charlottetown and for children in Grade I classes in rural areas through a mobile unit. Laboratory facilities are being decentralized through the establishment in the larger hospitals of branches which remain under the supervision of the Central Laboratory at Charlottetown. Venereal disease clinics are operated at Charlottetown and Summerside.

Free diagnostic services for tuberculosis are provided through five clinics maintained by the Division of Tuberculosis Control, and through a mobile unit which operates under voluntary auspices. At the Provincial Sanatorium at Charlottetown, streptomycin for treatment, and training and employment placement services are available free of charge to all patients. Sanatorium care, though not unqualifiedly free, is heavily subsidized by the Province. Free diagnostic services for cancer are given at a clinic located at Charlottetown. Hospitalization for diagnosis is provided without charge for a period of three days for indigent cancer patients.

Per diem grants are made to general hospitals for all patients and the Province also meets the cost of operating the Falconwood Mental Hospital.

Nova Scotia.—The principal Divisions of the Department of Public Health are Laboratories, Industrial Hygiene, Neuropsychiatry, Physical Fitness, Dental Hygiene, Nutrition, Nursing Service and Sanitary Engineering. In addition, a

98452—16

provincial program of generalized public health services is administered through seven local health divisions; the City of Halifax operates its own Health Department. Each division is staffed by public health nurses and sanitary inspectors under the supervision of a full-time divisional medical health officer.

Laboratory services, including bacteriological and other examinations and milk and water analyses, have been improved and extended through the work of the Provincial Central Laboratory at Halifax and branch laboratories at Sydney and Kentville. Laboratory tests and field investigations are also conducted by the Industrial Hygiene Division. Streptomycin for tuberculosis and penicillin for venereal disease cases are provided free by the Province.

Three mobile dental clinics provide treatment for children in rural areas; field psychiatrists provide mental guidance and consultant services in two regions and mobile chest X-ray units provide diagnostic services for tuberculosis. At Halifax, the Province operates a psychiatric ward and out-patient psychiatric service, a cancer clinic and a Kenny treatment clinic for poliomyelitis, all at the Victoria General Hospital.

Five provincially owned hospitals are operated under the direction of the Department—Victoria General Hospital, the Nova Scotia Hospital for mental illness, and three tuberculosis sanatoria. All treatment for tuberculosis and treatment for mental illness in the Nova Scotia Hospital is given without charge.

All approved hospitals receive a provincial per diem subsidy for each patient. Old-age and blind pensioners and recipients of mothers' allowances are eligible for limited medical services administered by agreement with Maritime Medical Care Incorporated, including home and office calls but excluding surgery, drugs and medical aids or appliances.

New Brunswick.—The Health Branch of the Department of Health and Social Services includes the following Divisions: Hospital Services and Cancer Diagnostic Clinics, Laboratories, Public Health Nursing, Communicable and Venereal Disease Control, Tuberculosis Control, Maternal and Child Health, Mental Health and Sanitary Engineering.

Medical health officers and some public health nurses are employed by the Province while other local health services are provided through 16 local sub-districts, each corresponding to a county and each having a board of health composed of members appointed by municipal councils. Responsibility for the various local public health functions is divided between the Province and the boards of health. Usually from three to five sub-districts are serviced by a district medical health officer assisted by public health nurses. In some cases, locally administered nursing services are subsidized by the Province.

Pathological, bacteriological, serological and chemical tests are provided by the Provincial Laboratories which also supervise the distribution of vaccines, sera and bacteriologicals, including free immunizing agents, drugs for venereal diseases and insulin for indigent diabetics through the Central Laboratory at Saint John and a branch laboratory at Fredericton. A Mobile Hygiene Laboratory conducts milk and water analyses during the summer months.

Free X-ray and diagnostic services for tuberculosis are provided at eight clinics in larger centres and pneumothorax treatment for convalescent tuberculosis patients is supplied by the Province through payment of physicians' fees. The Health Department supervises and provides free treatment and care in three privately

operated sanatoria in addition to the two owned by the Province. Ten cancer diagnostic clinics provide free diagnosis and free tissue examination service. Acute and immediate post-paralytic cases of poliomyelitis also receive free hospital treatment and grants are made to the Junior Red Cross to enable free treatment for other crippling conditions in children.

A mental health program includes the operation of preventive and diagnostic clinics and provides special psychiatric training for teachers on regular school staffs in the larger centres. Hospitalization for mental illness is available at the Provincial Mental Hospital at Saint John.

General care for all patients is subsidized by provincial per diem grants to approved hospitals.

Quebec.—The Ministry of Health maintains the following Divisions: County Health Units, Sanitary Engineering, Epidemiology, Laboratories, Demography, Hospitals for Mental Diseases, Public Charities, Industrial Hygiene, Nutrition, Venereal Disease, Tuberculosis, Health Education and Medical Service to Settlers.

The Division of County Health Units supplies services to 66 of the Province's 76 counties. The maintenance and operation of these units, each with a full-time medical health officer assisted by public health nurses and sanitary inspectors, is the responsibility of the Ministry of Health, with small local financial contributions. In addition, 16 larger municipalities operate their own health bureaus. Drugs supplied by the Provincial Department to physicians and health units include vaccines, sera, streptomycin for sanatoria patients and penicillin for venereal disease. Laboratory services, including bacteriological and other analyses, are available to physicians and health units at the Central Laboratory, Montreal. Assistance is given to agencies which operate clinics or dispensaries for prevention, case-finding and treatment of tuberculosis. The Department pioneered with the initiation in 1949 of a BCG immunization campaign administered to all new-born infants in hospitals and available to children generally through the health units.

Through the Division of Public Charities, recognized institutions receive provincial grants to cover about one-half of the cost of indigent care; the remainder is paid by the hospital board and the municipality of residence.

The Department operates public mental institutions and supervises tuberculosis sanatoria which are operated chiefly under private and religious auspices and in which the majority of patients receive care without charge.

The Medical Services to Settlers Division provides free nursing and physician services to residents of isolated areas. The staff consists of salaried nurses and part-time physicians paid on a fee-for-service basis. Services given include obstetrical care, examinations, vaccinations and immunizations.

Ontario.—The Department of Health carries on public health services through the following Divisions: Public Health Administration, Public Health Nursing, Maternal and Child Hygiene, Dental Services, Epidemiology, Venereal Disease Control, Tuberculosis Prevention, Industrial Hygiene, Laboratories and Sanitary Engineering.

Local public health services are available to about one-quarter of the population through 26 health units administered locally but with consultative services and financial support supplied by the Department. Elsewhere, local services are organized

through full- or part-time municipal health departments, and by the Province in unorganized territory. Provincial grants are made to local boards of health for school dental services and venereal disease clinics.

Public health legislation affecting water supplies, milk and food and other environmental sanitation is administered by the Department. Maternal and child health care is provided through clinics and, in addition, any expectant mother may receive one free prenatal examination. In certain northern areas a railway dental car operated by the Province provides treatment and two mobile units operated by the Red Cross provide dental examinations. Three other mobile dental units operate locally under the supervision of health boards or school authorities.

The Central Laboratory and 15 branch laboratories (nine provincially operated and six subsidized) carry out bacteriological and other examinations for clinics, hospitals and private physicians. Biologicals and other materials for the prevention and control of communicable diseases, insulin for indigent diabetics and streptomycin for tuberculosis patients, are distributed free of charge by the Department.

Chest clinics, held in approximately 170 centres, are financed mainly through funds of local tuberculosis associations and the Department. The Province pays the major portion of the cost of maintaining patients in sanatoria.

Cancer control in Ontario is administered by the Ontario Cancer Treatment and Research Foundation and provincial grants are given this organization to subsidize diagnosis and treatment in eight clinics.

Care is provided for the mentally ill in 17 institutions operated by the Province. Special units are concerned with the care of epileptics, the tubercular and the criminally insane. In addition, the Province operates four travelling mental health clinics. A provincial hospital for alcoholics and a treatment clinic have recently been opened.

Old-age pensioners, blind pensioners, mothers' allowance recipients and those receiving unemployment relief are eligible for free medical care including home and office calls, minor surgery and certain basic drugs. The program is operated by the Ontario Medical Association on per capita allowances paid by the Province.

Per diem grants, which vary according to hospital size, are paid to all public hospitals by both provincial and municipal authorities.

Manitoba.—Health and welfare services are administered by the Department of Health and Public Welfare consisting of four main Divisions: General Administration, Health Services, Psychiatric Services and Welfare Services.

Local preventive health services including local health units and diagnostic units are maintained and operated by the Health Extension Section of the Health Services Division, which recovers part of the costs from the municipalities served. Public health services, currently covering approximately one-third of the provincial population, are provided through 14 full-time units, each comprising a variable number of municipalities (approximately another third of the population is covered by Winnipeg's health service facilities). In two health unit areas (Dauphin and Selkirk) prepaid diagnostic X-ray and laboratory facilities have been organized. Outside the health unit areas the Provincial Nursing Service provides public health services.

The principle of district organization is also followed in the legislative provisions for hospital and medical care. Of the 34 hospital districts now organized, all but two contain at least one general hospital often augmented by one or more medical nursing units. Medical care has also been organized through municipal prepayment plans, provincially subsidized.

Provincial mental institutions are operated at Winnipeg, Selkirk and Brandon and a school for the mentally defective at Portage la Prairie. Community mental health services are also conducted, including out-patient services at mental hospitals and child guidance clinics.

Provincially operated clinics provide preventive and treatment services for venereal disease. Tuberculosis control is administered by the Sanatorium Board of Manitoba and services include diagnostic and travelling clinics, chest X-ray surveys and a rehabilitation program. The Province assists in the program by maintaining a Central Registry of Tuberculosis and a follow-up service for discharged patients by public health nurses. The cost of hospitalization and treatment in sanatoria is met by provincial grants and by payments from municipalities determined by the patient-days accrued by residents. The Manitoba Cancer Relief and Research Institute, which is subsidized by the Province, administers all cancer activities. A free cancer biopsy service is provided throughout the Province while radium and X-ray treatments are available without charge in rural areas and at a nominal charge in urban areas.

Laboratory services are provided through provincial laboratories at Winnipeg, Brandon and Portage la Prairie. In addition, the Department distributes drugs to doctors, hospitals and government agencies including penicillin and other drugs for venereal disease, insulin and other biologicals for indigents and antibiotics for tubercular patients.

The Provincial Government contributes a per diem grant to hospitals and sanatoria for all public-ward patients and lump sum grants to teaching hospitals.

Saskatchewan.—The Saskatchewan Department of Public Health was reorganized in 1950 and now includes four main Branches: Preventive Services, Regional Health Services, Medical and Hospital Services and Psychiatric Services. The Health Services Planning Commission functions as an advisory and planning agency on major policy and administrative matters in the Department.

The Preventive Services Branch includes divisions of communicable disease control, child health, laboratories, venereal disease control, nursing services, dental health, nutrition and sanitation. The Communicable Diseases Division distributes free vaccines and sera to doctors, health departments and hospitals, and supervises immunization programs and poliomyelitis clinics at Saskatoon and Regina. The Child Health Division provides services for crippled children, including mobile consultation units and a rehabilitation centre for the cerebral palsied. Public health laboratory services and the free distribution of certain drugs and biologicals are carried out by the Provincial Laboratories. Field services for venereal disease, tuberculosis, mental health and other public health programs are provided by the Nursing Services Division.

The Regional Health Services Branch is responsible for the organization of health regions which are administered by locally elected health boards although staff is appointed and financial assistance is provided by the Province. Seven of the 12 proposed regions are currently in operation. In addition to the general

public health services provided in all regions, the Swift Current Health Region has a medical-care plan including general practitioner, specialist, diagnostic and limited dental services. The plan is financed by personal and property taxes with some Provincial Government contributions. In addition, many districts have municipal doctor programs with medical services provided under a contract between the municipal authority and the medical practitioner.

Responsibility for the administration of the Saskatchewan Hospital Services Plan rests with the Medical and Hospital Services Branch of the Department. All residents are eligible for hospital care under the compulsory plan financed by an annual tax of \$10 for all persons 18 years of age or over and \$5 for persons under 18 years of age, with \$30 as a maximum family tax; additional funds are provided by the Province as needed. Payment of the tax for social assistance recipients is by the government agency responsible for their hospital care and treatment. In addition to free hospital care, medical, dental and optical services and some drugs are provided to old-age and blind pensioners and their dependants, to beneficiaries of mothers' allowances and to social-aid groups including provincial wards.

The Psychiatric Services Branch supervises psychiatric hospitals and administers community psychiatric services including clinics. The Province provides free care and treatment for all mentally ill and mentally defective persons requiring hospitalization. The Province's tuberculosis control program is operated by the Saskatchewan Anti-tuberculosis League. Stationary and mobile clinics give diagnostic service and pneumothorax treatments while provincial per diem grants and municipal levies pay the cost of hospital care and treatment. The Saskatchewan Cancer Commission co-ordinates all cancer control measures and operates publicly financed consultative, diagnostic and treatment clinics at Saskatoon and Regina.

Alberta.—The Department of Public Health includes Divisions of Communicable Disease, Public Health Education, Hospital and Medical Services, Laboratory, Public Health Nursing, Social Hygiene, Sanitary Engineering, Cancer Services, Mental Health, Tuberculosis Control, Entomology, Nutrition Services and Vital Statistics.

For the provision of local health services, the Province is divided into health unit districts. The units are administered, with Departmental supervision and financial aid, by local boards of health composed of members appointed by local governments. One-half of the 18 units currently organized are directed by full-time medical health officers and one-half by public health nurses. Outside the health unit areas, the Department operates a district nursing service in outlying communities, and is generally responsible for health services in unorganized territory. The larger cities have their own full-time health departments.

Free services regularly provided through Departmental clinics include diagnosis and treatment for venereal disease; medical examination for cancer; mental guidance and psychiatric examinations; X-ray examinations and tests for tuberculosis at stationary and travelling clinics and mobile X-ray units. Provincial laboratory services at Edmonton and Calgary are available to all doctors and approved hospitals and sera and biologicals are distributed for preventive work.

On the recommendation of provincial cancer clinics, surgical, X-ray and radium treatment and hospitalization for a period of up to two weeks for diagnostic purposes are provided by the Department. There are four provincial institutions for the

mentally ill and one for mental defectives. Sanatoria care and treatment are provided without charge for all resident tubercular patients and out-patient pneumothorax services are also available.

The Province provides full medical (including specialist), optical and extensive dental services to old-age and blind pensioners, recipients of mothers' allowances and their dependants. The Department also bears the cost of hospital and medical care for rheumatoid arthritic patients under 21 years of age and provides all residents suffering from the after-effects of poliomyelitis with medical, surgical and hospital care and rehabilitation services. All maternity patients satisfying resident requirements may be hospitalized for a twelve-day period at provincial expense.

Over two-thirds of the population of the Province is provided with standard hospitalization through a district municipal hospital program. The plan is operated at the local level under provincial supervision. Costs are distributed among the patient, the municipality and the Provincial Government. The patient is charged \$1 per day and the municipality pays the remainder of the basic ward rate, raised by a mill-rate tax on real property. The Provincial Government then reimburses the municipality for one-half of this amount.

British Columbia.—The Department of Health and Welfare is divided into two branches and, in addition, there is a Hospital Insurance Commission directly responsible to the Minister of Health and Welfare.

The Health Branch consists of three bureaus, two located at Victoria and one at Vancouver. The Bureau of Local Health Services at Victoria includes Divisions of Nutrition, Health Units, Public Health Nursing, Environmental Sanitation and Preventive Dentistry. The Central Administration Bureau, also at Victoria, includes Vital Statistics and Public Health Education. The Divisions of Tuberculosis Control, Venereal Disease Control and Laboratories form the Bureau of Special Preventive and Treatment Service located at Vancouver.

The provision of local public health services is on a health-unit basis. These units are administered and staffed by the Province, but are jointly financed by the Province and the local municipalities concerned. Thirteen of the 18 units planned are in operation. In isolated areas, Public Health Nursing Districts, staffed by public health nurses and sanitary inspectors, are forerunners of fully organized health units. Vancouver and Victoria have their own city health departments; other centres have part-time medical health officers.

Special provincial public health services include tuberculosis clinics which provide free diagnostic and consultative service, venereal disease clinics which offer free diagnosis and treatment, and maternal and child health clinics operated by public health nurses which provide immunization and pre- and post-natal advice. Branch laboratories are maintained in various parts of the Province through which immunizing agents are distributed free of charge to doctors, health officers and public health nurses. Ten communities have pre-school and Grade I dental programs with service provided by private resident dentists in which costs are met by provincial grants (about 50 p.c.) and by local contributions and flat minimum charges to parents of children receiving treatment. In connection with mental health services the Province operates stationary and travelling child-guidance clinics. A clinic of psychological medicine has been established at the provincial hospital at Essondale; it functions as an investigatory and active treatment centre for short-term patients.

Provisions for the treatment and control of cancer, which include a treatment centre and a nursing home at Vancouver, consultative and diagnostic clinics located throughout the Province and a free province-wide biopsy service, are the responsibility of the British Columbia Cancer Foundation, an official agent of the Provincial Government. The Province pays the operating costs of the Foundation. The Province also helps finance voluntary programs concerned with the physical rehabilitation of paraplegics and cerebral palsied children, the care and treatment of arthritics, and the maintenance of blood transfusion services.

Institutions for the care of tubercular and mental patients and infirmaries for persons with incapacitating disabilities are operated by the Province. Indigents are hospitalized in these institutions at public expense while other patients pay in accordance with their ability. Rehabilitation and visiting homemaker services are available to tubercular patients.

Standard hospital care is available to all residents through a compulsory pre-payment plan. The plan is financed by annual premiums, amounting in 1952 to \$30 for a person without dependants and \$42 for a person with one or more dependants, supplemented by provincial and municipal contributions and additional patient payments up to a family maximum of \$35 per year. Full medical, surgical and obstetrical, dental and optical care, and some drugs are provided old-age and blind pensioners, mothers' allowance recipients and their dependants, who are also covered by the hospital plan, their premiums being paid by the Province. A similar program, with costs of some services shared by the municipalities, is provided for social-assistance groups including provincial wards.

Section 3.—Institutional Statistics*

This Section provides a brief outline of hospital conditions in Canada. The figures included in the tables are for 1950 (except for mental institutions) while those published in the 1951 Year Book are for 1948. Figures for the intervening year may be obtained from the *Annual Report of Hospitals 1949* and the *Annual Report of Tuberculosis Institutions 1949*, available from the Dominion Statistician, Ottawa.

For statistical purposes hospitals are divided into three main groups on the basis of their admission policies—public hospitals, federal hospitals and private hospitals. Public hospitals are subdivided into acute disease hospitals, chronic disease hospitals, mental institutions and tuberculosis sanatoria. Hospitals with a relatively rapid turnover of patients, i.e., acute disease hospitals, are further subdivided according to the type of medical care provided into general and special hospitals. The latter group includes contagious diseases, women's, children's, convalescent and unclassified hospitals.

The number of hospitals in Canada which reported for 1950 is shown in Table 1, classified according to type and province. The significance of facilities in Canadian hospitals is shown in Table 2 which indicates the distribution of bed capacity in 1950, by provinces, according to type of hospital. A comparison of data in both tables will reveal the relative size of hospitals of various types.

* Except where otherwise indicated, this Section has been revised in the Institutions Section of the Health and Welfare Division, Dominion Bureau of Statistics.

Two important factors should be taken into account for an effective interpretation of the information shown in Table 2. Firstly, it should be noted that bed capacity expresses the number of beds for which the hospital was designed. It is calculated on the basis of a standard floor area per bed and varies in the different provinces. The use of this figure may eliminate over-crowding as a disturbing factor in certain kinds of statistical studies. Secondly, the bed complement only, i.e., the number of beds actually set up, is shown in these tables for tuberculosis sanatoria. For mental institutions and other hospitals bed capacity is shown; the bed complement for these institutions is available in specialized publications and may be compared with bed-capacity figures to obtain a measure of over-crowding in such hospitals.

The fact that many institutions also provide care of a kind different from the classification in which they have been placed should be taken into account. A major distortion that may occur in the interpretation of these figures is illustrated in Tables 1 and 10. Table 1 gives the number of units in public hospitals that are reserved for tubercular patients; Table 10 shows the bed complement of these units.

³ Exclusive of tuberculosis and incurable units.

Subsection 1.—Statistics of Public Hospitals for Acute Diseases

Movement of patients, personnel and hospital facilities for in-patients in both general and special public hospitals during 1950 are summarized in Tables 4 and 6. Comparative workload, staff per patient, etc., may be obtained from these data. The last item in Table 5, cost per patient day, where revenues and expenditures are divided into main sources and objects, respectively, provides a significant connection between patient and financial statistics.

Organized Services.—Organized services analysed in Table 6 are hospital departments or services in charge of qualified specialists. Many of the smaller public general hospitals have available certain facilities for specialized services but, since these are not organized, they are not included in the figures in the table.

Organized Out-Patient Departments.—Out-patient departments are operated by hospitals for the treatment of patients who do not occupy in-patient beds. The extension of out-patient services to patients of modest means has far-reaching and beneficial effects. It may eliminate unnecessary admissions to in-patient wards of hospitals or may serve to secure necessary hospitalization.

Subsection 2.—Statistics of Mental Institutions

The 64 mental institutions operating in Canada during 1949 include two Federal Government and three private institutions. The three public institutions in British Columbia are reported as one hospital. Table 8 contains information from all these institutions. Total patients shown in the table include 4,619 non-residents, either on parole or boarding out, distributed by provinces as follows: Nova Scotia, 134; New Brunswick, 190; Quebec, 1,370; Ontario, 2,089; Manitoba, 193; Saskatchewan, 330; Alberta, 82; and British Columbia, 231.

Financial data for 1949 shown in Table 9 cover only public mental institutions and include neither private institutions (one in Quebec, one in Ontario and one in British Columbia) nor Federal Government institutions (one in Quebec and one in Ontario).

Subsection 3.—Statistics of Tuberculosis Institutions

Table 10 shows that 22.3 p.c. of total bed complement provided for tubercular patients in 1950, i.e., 3,961 of the 17,790 beds, were located in Federal Government sanatoria, tuberculosis units in Federal Government hospitals, and tuberculosis units in public general hospitals. Movement of patient statistics in Table 11 include data from these sources. As a result, any comparison of movement of patients and personnel statistics will be misleading since the latter involve only personnel of public sanatoria.

During 1950 and 1951 new facilities included a nurses' residence at Westminster Hospital, London, Ont., with accommodation for 216 nurses, and the remodelled Annex at Halifax, N.S., which now has accommodation for 78 patients requiring domiciliary care. Under the hospital construction program to replace outmoded accommodation by modern fireproof buildings, progress was made on the construction of new facilities at Lancaster Hospital, Saint John, N.B., which will be completed in 1952. A 60-bed addition to the Veterans' Hospital at Victoria, B.C., will also be completed in 1952 and a 300-bed hospital is under construction at Quebec, Que.

Early in 1952 the Veterans' Home at Halifax was closed, Lyndhurst Lodge at Toronto was transferred to the Canadian Paraplegia Association, Christie Street Hospital was transferred to the City of Toronto to be used as a home for the aged, and York Health and Occupational Centre at Toronto was closed.

Amalgamations in 1950 and 1951 included: Western Counties Veterans' Lodge with Westminster Hospital, London, Ont.; Senneville Health and Occupational Centre with Ste. Anne's Hospital, Ste. Anne de Bellevue, Que.; Ridgewood Health and Occupational Centre with Lancaster Hospital, Saint John, N.B.; Veterans' Home with Deer Lodge Hospital, Winnipeg, Man.; Calgary Convalescent Hospital with Colonel Belcher Hospital, Calgary, Alta.; and Hycroft Veterans' Lodge with Shaughnessy Hospital, Vancouver, B.C. The functions of these amalgamated units remain unchanged but they now operate as wings or divisions of the parent unit.

The numbers of patients in Veterans Affairs hospitals at Dec. 31, 1950, and Dec. 31, 1951, were 7,655 and 7,598, respectively, classified by status and treatment groups as follows:—

Patient Strength	1950	1951	Treatment Group	1950	1951
World War I.....	4,802	4,824	General.....	5,759	5,681
World War II.....	2,336	1,964	Tuberculosis.....	624	544
Other.....	517	810	Mental.....	1,272	1,373

Clinical treatments in Departmental institutions numbered 483,202 in 1950 and 451,149 in 1951.

Department of National Defence Hospitals.*—Table 14 shows accommodation and movement of patients in National Defence hospitals for the year 1951. Thirty-one of these hospitals are equipped to provide radiology services, 31 to provide laboratory services, 14 have facilities for physio-therapy treatments and all but one conduct out-patient departments.

* Revised in the Department of National Defence, Ottawa.

¹ Integrated with Department of Veterans Affairs hospital at the same location.
² This unit was not functioning as an individual establishment until Jan. 1, 1952.
³ A number of the listed units were activated in the latter part of 1951. In some cases no data are available and in other cases the data given are for comparatively short periods.

National Health and Welfare Hospitals.—The Department operates quarantine and immigration hospitals, hospitals for sick mariners, hospitals for lepers and hospitals for the Indian and Eskimo population. Table 15 provides data on accommodation and the movement of patients in these institutions.

Data for 1950 show that there were 570,499 patient days in hospitals operated by Indian Health Services. Total patient days in immigration, sick mariners and leper hospitals in 1951 were 64,167. There were no patients suffering from major infectious diseases in any of the quarantine units during the year 1951. These units are kept in reserve to meet emergency requirements.

PART II.—PUBLIC WELFARE AND SOCIAL SECURITY*

Responsibility for social welfare in Canada has rested in large part on the provinces which, in turn, have delegated an important share of this responsibility to the municipalities. While constitutional authority has not changed, except with respect to unemployment insurance and old age pensions, the financial participation of the Federal Government has been greatly extended in the past two decades in the provision of income maintenance payments.

The creation of the Department of National Health and Welfare in 1944 established for the first time in the Federal Government a Department in which matters of welfare are a major responsibility. The Department is charged with the administration of Federal Acts relating to welfare which are not assigned by law to other departments. In addition to the general promotion of social welfare, the Welfare Branch of the Department administers the family allowances program, the old age security program and the federal aspects of old age assistance and allowances for blind persons. In addition, grants are made to the provinces for physical fitness.

Unemployment insurance is administered by the Unemployment Insurance Commission; welfare and health services for veterans by the Department of Veterans Affairs; and the welfare of Indians and Eskimos by the Department of Citizenship and Immigration and the Department of Resources and Development, respectively.

Administration and financial responsibility in other fields of welfare, such as mothers' allowances, child protection and general assistance or relief, are left entirely with the provinces and their local subdivisions.

Major developments in 1951 included the amendment to the British North America Act allowing the Federal Parliament to legislate with respect to old age pensions, and the changes in federal and provincial legislation for old age income security and for pensions for the blind.

Section 1.—Federal Government Programs

Subsection 1.—Family Allowances

The Family Allowances Act, 1944, was introduced as a basic social security measure designed to assist in providing equal opportunity for all Canadian children. The allowances, which involve no means test, are paid entirely out of the Federal Consolidated Revenue Fund and are not part of taxable income under income tax, although persons with children eligible for family allowances obtain a smaller income tax exemption for such children than for children not so eligible.

Allowances are payable in respect of every child under the age of 16 years who was born in Canada or has been a resident of the country for one year, or whose father or mother was domiciled in Canada for three years immediately prior to the birth of the child. Monthly payment is made normally to the mother although any person who substantially maintains the child may be paid the allowance on his behalf. The allowances are paid at the monthly rate of \$5 for each child under 6 years; \$6 for each child from 6 to 9 years; \$7 for each child from 10 to 12 years; and \$8 for each child from 13 to 15 years. The allowances are paid by cheque,

* Except as otherwise indicated, this Part was prepared in the Research Division, Department of National Health and Welfare, Ottawa.

except for Eskimo children and a group of Indian children for whom payment is made largely in kind because of lack of exchange facilities in remote areas and the need for education in the use of nutritive foods.

If it is satisfactorily shown to the authorities that the allowances are not being spent for the purpose outlined in the Act, payment may be discontinued or made to some other person or agency on behalf of the child. Allowances are not payable for any child who fails to comply with provincial school regulations or on behalf of a girl who, although she is under 16 years of age, is married.

Family allowances are administered by the National Director of Family Allowances of the Department of National Health and Welfare through Regional Directors in offices located in each provincial capital. A Welfare Section in each Regional Office deals with welfare questions arising out of the administration of allowances. A Supervisor of Welfare Services advises each Regional Director and reports through him to the Chief Supervisor of Welfare Services, who acts in a similar advisory capacity to the National Director. The actual preparing and issuing of the cheques is the responsibility of the treasury division of each Regional Office which reports to the Chief Treasury Officer of the Department of Finance with the Department of National Health and Welfare.

The Regional Director for the Yukon and Northwest Territories, located at Ottawa, is responsible for payments to families in those areas. Close co-operation is maintained with the Departments of Citizenship and Immigration and of Resources and Development which are responsible for the welfare of Indians and Eskimos, respectively (see Subsection 5, pp. 258-260).

¹ Based on gross payments for March. 1949.² Payment of Family Allowances implemented in April 1949.

Subsection 2.—Old Age Security

Under the Old Age Security Act of 1951, effective January 1952, a universal pension of \$40 per month is payable by the Federal Government to all persons aged 70 or over, subject only to a residence qualification. The resident requirement is 20 years immediately preceding commencement of pension with certain temporary absences allowed. Where the applicant has not so resided for the complete 20 years the periods of absence may be made up by having been present in Canada, prior to the 20-year period, for double the periods of absence; for these persons, there is a further requirement of one year's residence immediately preceding the commencement of the pension.

Payment of the pension is suspended when the pensioner leaves Canada. On his return, the pension may be resumed and, in the case of absences not exceeding six months, payments may then be made for as much as three in any calendar year.

The program is financed on a pay-as-you-go basis. Payment of the pension is made from the Consolidated Revenue Fund and charged to the Old Age Security Fund account. The income of the Old Age Security Fund is derived from three sources. First, there is a 2 p.c. tax on personal taxable income, that is, on income less exemptions and deductions. The maximum tax per person is \$60 per annum the tax became effective in July 1952, resulting in a maximum tax of \$30 for the year. The fund will also receive the amount collected by a 2 p.c. tax on corporate

taxable income and the proceeds of a 2 p.c. sales tax. The latter tax is not new but is simply an earmarking of one-fifth of the existing sales tax of 10 p.c. Temporary loans may be made to the Old Age Security Fund, subject to repayment as directed.

It is estimated that the pension payments will cost from \$322,000,000 to \$330,000,000 in the first year of operation—the year ending Mar. 31, 1953. Collections from the three taxes for the same period are estimated at: personal tax, \$52,000,000; corporate tax, \$48,000,000; and sales tax, \$135,000,000; a total of \$235,000,000.

The total number of persons in Canada who were 70 years of age or over in 1952 is estimated at 682,000. Some of these will not be eligible because of insufficient years of residence and certain eligible persons may not apply.

The program is administered by the National Director of Old Age Security of the Department of National Health and Welfare through the ten regional offices established in connection with the payment of family allowances. The two programs are administered largely by the same personnel.

Persons in receipt of pension at the end of 1951 under the Old Age Pensions Act of 1927 were transferred to the rolls of the universal pension as of January 1952, without further action on their part. Other persons make application to the regional director located at their provincial capital. The regional director for the Yukon and Northwest Territories is located at Ottawa. In certain provinces supplements are payable to recipients of old age security.

Subsection 3.—Unemployment Insurance and National Employment Service

In 1940, by an amendment to the British North America Act, the Federal Government was given jurisdiction in the field of unemployment insurance and the Unemployment Insurance Act was passed, establishing a national system of unemployment insurance which is outlined in Chapter XVIII.

The National Employment Service is operated in conjunction with the unemployment insurance scheme. It is administered through the employment and claims offices and supervised by the Department of Labour. This program is also described in Chapter XVIII.

Subsection 4.—Prairie Farm Assistance

The Prairie Farm Assistance Act is administered by the Department of Agriculture; a description of the legislation is given in Chapter X.

Subsection 5.—Welfare Services for the Indian and Eskimo

Indian Welfare.*—In addition to direct relief of all kinds for destitute Indians which is provided to prevent hardship, the Government of Canada, through the Department of Citizenship and Immigration, promotes a number of activities designed to assist individuals and bands to achieve self-support or to better their economic position. During the year ended Mar. 31, 1951, \$3,925,172 was spent for direct relief in the form of food, fuel, clothing, household equipment and care for helpless and indigent Indians. In addition, special diets were provided for convalescent tubercular Indians in the post-hospitalization period.

Indians in Canada are eligible for family allowances and old age security on the same basis as non-Indians. Moreover, in most provinces Indians are eligible for the provincially administered old age assistance pension payable to persons 65 to 69 years of age subject to a means test. Blind Indians in most provinces are also eligible for the blind persons allowances.

Family allowances amounting to \$3,619,075 were paid to 20,399 Indian families in 1951. This income has exerted a very great influence on Indian Reserves toward the betterment of the children's diet, their clothing and school attendance. It is estimated that approximately \$2,500,000 will be paid annually to Indians 70 years of age or over through old age security pensions. This income, in addition to that paid to Indians in the 65-69 age group and to blind Indians, will be of great benefit to these people.

During the year ended Mar. 31, 1951, Indians who were unable to provide adequate housing for themselves were assisted in the construction of 1,082 new houses and with repairs to 2,052 houses. The Departmental contribution to this program was \$911,991 for new construction and \$195,701 for repairs.

Grants for settlement under the Veterans' Land Act were obtained for 122 Indian veterans, bringing the total number of such grants to 1,212 amounting to \$2,721,868.

The Indian Affairs Branch operates a service for the promotion and sale of Indian handicraft to merchants in all parts of Canada. The articles include utilitarian and ornamental or novelty baskets and items made of bark and wood, the

* Prepared in the Indian Affairs Branch, Department of Citizenship and Immigration, Ottawa.

value of which amounted to \$30,000 in 1951. This work provides a steady income for a limited number of Indian women and men and is done mostly in the home. Handicraft articles are also often produced on a part-time basis for local sale to tourists.

The fur-development program undertaken in co-operation with the various provinces was continued during 1951 and the benefits accruing to Indians were most apparent with respect to beaver production in Manitoba, Saskatchewan and Ontario. In the 1951 season these three Provinces took over 100,000 beaver pelts valued at more than \$2,000,000 of which approximately \$1,300,000 was paid to the participating Indian trappers. In Quebec, extensive areas are set aside exclusively for Indian trappers under joint management by the Indian Affairs Branch and the Quebec Department of Fish and Game. In these reserves, the beaver has been successfully rehabilitated, by means of management and control through registered traplines, from a state of virtual depletion to the point where Indians, in 1951, realized \$376,032 from that fur-bearer alone. The program has also been extended to take in such fur-bearers as the fisher and the marten.

Eskimo Welfare.*—One of Canada's most challenging welfare-administrative problems is the task of assisting its Eskimo citizens to adjust themselves to changing conditions in the Arctic. Since the turn of the present century, when trading posts started to appear in Eskimo territory, marked changes have taken place in Eskimo culture and ways of living and recently improved means of transportation and communication have stimulated interest in the Arctic and have accelerated those changes.

Rifles and modern tools and equipment have largely supplanted primitive weapons and implements and most Eskimos now depend, to some extent at least, on the trade stores for their needs although they are still able to obtain a good part of their food, clothing and shelter off their own country. Their purchases of imported goods must be made from trapping proceeds and, except for muskrats which are available in the Mackenzie Delta only, the white fox is the only resource of any considerable economic value to the Eskimos. And an unstable resource it is, being subject to wide fluctuations both in numbers and in value from year to year. This has been very apparent in recent years when prices have declined to particularly low levels.

The Northern Administration and Lands Branch of the Department of Resources and Development is responsible for administration of Eskimo affairs. The Department of National Health and Welfare is responsible for health and medical services. Royal Canadian Mounted Police detachments throughout the north undertake field duties for both Departments. The problems involved in looking after a sparse Eskimo population scattered over about 900,000 sq. miles of territory requires the continuous co-operation of all northern inhabitants, including teachers, missionaries, traders, doctors, nurses, radio operators and weather-station personnel.

Missions, assisted by government grants, operate hospitals at Aklavik, Chesterfield Inlet and Pangnirtung, and the Department of National Health and Welfare has nursing stations at Coppermine, Fort Chimo, Coral Harbour, Port Harrison, Cape Dorset and Lake Harbour. Extensive tuberculosis and other medical surveys have been made in recent years and, where necessary, patients have been brought

* Prepared in the Northern Administration and Lands Branch, Department of Resources and Development, Ottawa.

to hospitals outside for treatment. After-care of such patients and their rehabilitation after returning home sometimes raises problems requiring close co-operation of all parties concerned.

Government schools are operating in eight of the larger centres—Aklavik, Tuktoyaktuk, Coppermine, Chesterfield Inlet, Coral Harbour, Cape Dorset, Port Harrison and Fort Chimo. At a number of other settlements schools are operated by missions, assisted by Government grants. Missions are also assisted in the operation of two industrial homes, one at Chesterfield Inlet and the other at Pangnirtung, where aged and physically handicapped Eskimos are cared for. In co-operation with the Canadian Handicrafts Guild, Northern Administration has been promoting handicrafts in the Eastern Arctic. This development began in 1949 and each year since then qualified instructors have been sent into the field to expand the work. Many interesting items have been produced and readily disposed of throughout Canada. Eskimos are encouraged to follow trades, such as reindeer herding and fishing, and are given some assistance in their efforts.

Studies are being made relating to the conservation of the wildlife resources, particularly caribou and marine animals, on which Eskimos depend greatly for food and clothing. Game preserves have been established and regulations made to preserve these resources for the sole benefit of the Eskimo population.

Family allowances are paid to Eskimos in kind from a list drawn up in co-operation with the Department of National Health and Welfare. This list is designed to supplement rather than to supplant the normal native diet. Under recent legislation, Eskimos also enjoy the full benefits of old age security pensions, old age assistance and pensions for the blind.

Subsection 6.—Government Annuities*

Under the Government Annuities Act (R.S.C. 1927, c. 7, amended by c. 33, 1931) passed in 1908, the Federal Government carries on a service to assist Canadians to make provision for old age. The Act is administered by the Minister of Labour.

A Canadian Government annuity is a fixed yearly income purchased from and paid by the Government of Canada. The annuity is payable in monthly instalments for life, or for life and guaranteed for a period of years. The minimum annuity is \$10 and the maximum \$1,200 a year. Annuity contracts may be deferred or immediate. Under deferred annuity contracts purchase is by periodic or single premiums. Immediate annuity contracts provide immediate income.

The property and interest of the annuitant are neither transferable nor attachable. In the event of the death of the annuitant before a deferred annuity vests, all money paid is refunded to the purchaser or his legal representative with interest. Provision is made in the Act for group annuity contracts, whereby employers may contract for the purchase of annuities on behalf of their employees, or associations on behalf of their members, the purchase money being derived partly from wages and partly from employer contributions. Group annuity plans now in effect cover a variety of industries and many municipal corporations throughout Canada. Annuities arising from individual contracts are taxable as to the interest portion of the annuity payment and the return-of-capital portion is exempt; annuities arising from approved pension plans are fully taxable but the employee and the employer are entitled to tax exemption year by year on their annual contributions to the pension plan.

* Revised in the Government Annuities Branch, Department of Labour, Ottawa.

From Sept. 1, 1908, the date of the inception of the system, to Mar. 31, 1952, the total number of annuity contracts and certificates issued was 331,791. Of these, 42,098 have been cancelled (including 3,158 cancelled in 1951-52) leaving in effect on Mar. 31, 1952, 289,693 contracts and certificates. The total amount of purchase money received up to Mar. 31, 1952, was \$710,499,698.

Up to Mar. 31, 1952, 915 corporations, institutions and associations, as compared with 900 up to Mar. 31, 1951, had entered into agreements with the Government to purchase annuities. Under these agreements, 131,749 employees or members were holding certificates for purchase of deferred annuities as compared with 128,299 one year earlier. The number of certificates issued under groups in the year 1951-52 was 12,135 as compared with 15,028 in the previous year.

Section 2.—Federal-Provincial Programs

Subsection 1.—Old Age Assistance

The Old Age Assistance Act of 1951, effective January 1952, provides for financial aid to the provinces toward the provision of assistance, not exceeding \$40 a month, to persons aged 65-69 subject to a residence qualification of at least 20 years. Within the limits of the Federal Act each province is free to fix the amount of the maximum assistance payable, the maximum income allowed and other conditions of eligibility. The Federal Government's contribution per recipient cannot exceed 50 p.c. of \$40 per month or of the assistance paid, whichever is less.

For an unmarried person the total income allowed including assistance cannot exceed \$720 a year; for a married couple, \$1,200 a year; where the spouse is blind within the meaning of the Blind Persons Act, the total income of the couple cannot exceed \$1,320 a year. The exact pension payable in each case depends on the amount of outside income and the resources of the applicant and his spouse. To be eligible for assistance the applicant must not be in receipt of an allowance under the Blind Persons Act or the War Veterans' Allowance Act. The applicant must have resided in Canada for at least 20 years immediately preceding the commencement of the assistance, but may have certain temporary absences; where the applicant has not so resided for the 20 years he must have been physically present in Canada, prior to the 20 years, for a total period equal to twice the total of the absences during the 20 years.

Implementation of the program in any province is contingent upon the province passing enabling legislation and signing an agreement with the Federal Government. The program became effective January 1952 in all provinces, except Newfoundland, and in the Northwest Territories; in Newfoundland it became effective in April 1952. No agreement had been made with the Yukon Territory by Mar. 31, 1952.

Administrative responsibility for the program is vested in the province; the provincial plan for such administration must be approved by, and cannot be changed except with the consent of, the Governor in Council. Assistance is paid by the province with federal reimbursement made through the Department of National

Health and Welfare. The Old Age Assistance Division of that Department administers the federal aspects of the program. In certain provinces supplements are payable to the recipients of old age assistance.

Table 6 presents the statistics available for the early months of the program; it is not anticipated that the program will mature fully until it has been effective five years.

Subsection 2.—Old Age Pensions Act 1927

For practical purposes the Old Age Pensions Act of 1927 ceased to be effective Dec. 31, 1951, at which time all recipients of pensions thereunder were automatically transferred to the rolls of the universal pension payable under the Old Age Security Act (*see* p. 256). A description of the provisions of the Old Age Pensions Act of 1927 may be found in the Year Book 1951, pp. 234-235. Statistics on the operation of the program up to Dec. 31, 1951, are given in Table 7.

Subsection 3.—Allowances for the Blind

The Blind Persons Act of 1951, effective January 1952, provides for financial aid to the provinces toward the provision of allowances not exceeding \$40 a month to blind persons aged 21 or over, subject to a residence qualification of at least 10 years. Within the limits of the Federal Act, each province is free to fix the amount of the maximum allowance payable and the maximum income allowed. The Federal Government's contribution per recipient cannot exceed 75 p.c. of \$40 per month or of the allowance paid, whichever is less.

For an unmarried person, the total income allowed including the allowance cannot exceed \$840 a year; for an unmarried person with one or more dependent children, \$1,040; for a married couple, \$1,320 a year; where the spouse is also blind within the meaning of the Blind Persons Act, the total income of the couple cannot exceed \$1,440 a year. The exact allowance payable in each case depends on the amount of outside income and the resources of the applicant and his spouse. To be eligible for an allowance the applicant must not be in receipt of assistance under the Old Age Assistance Act, of an allowance under the War Veterans' Allowance Act, of a pension under the Old Age Security Act or of a pension in respect of blindness under the Pensions Act. The applicant must have resided in Canada for at least 10 years immediately preceding the commencement of the allowance but may have certain temporary absences; where the applicant has not so resided for the 10 years he must have been physically present in Canada, prior to the 10 years, for a total period equal to twice the total of the absences during the 10 years.

Implementation of the program in any province is contingent upon the province passing enabling legislation and signing an agreement with the Federal Government. The program became effective in January 1952 in all provinces and in the Yukon and Northwest Territories.

Administrative responsibility for the program is vested in the province; the provincial plan for such administration must be approved by, and cannot be changed except with the consent of, the Governor in Council. The allowances are paid by the province with federal reimbursement made through the Department of National Health and Welfare. The Old Age Assistance Division of that Department administers the federal aspects of the program. In certain provinces, supplements are payable to the recipients of allowances for the blind.

Table 8 presents the statistics available for the early months of the program.

¹ For the month of March of the fiscal year indicated.

² Based on population estimate for preceding June.

³ Nine months ended Dec. 31; the figures refer to the average pension in December, the number of pensioners in December, the population estimate for June 1950 and the federal contribution during the nine months ended Dec. 31, 1951.

⁴ A monthly pension of \$40 was paid to the one blind pensioner in the Northwest Territories.

Subsection 4.—National Physical Fitness Program

A program of physical fitness and recreation for Canada was introduced with the proclamation on Oct. 1, 1943, of the National Physical Fitness Act. A National Council was established to promote the well-being of the people of Canada through physical fitness and recreational activities. The Council, set up on Feb. 15, 1944, is an executive body appointed by the Governor General in Council, which meets twice each year. In some provinces, provincial councils function as advisory bodies to the provincial government.

The Council has sponsored and initiated a number of projects of significance. National Fitness Scholarships are awarded annually to give material assistance to professionally qualified Canadians with three years' successful experience who desire to improve their professional services. The Council has convened a number of National Conferences including the First National Conference on Undergraduate Professional Preparation and the First National Conference on Employee Recreation. The Canadian Aquatic Standards were developed out of such a conference and the Canadian Sports Advisory Council was formed as a result of conferences of national sports governing bodies called by the National Council on Physical Fitness.

Further, a National Achievement Award has been initiated to honour those who have made outstanding contributions in their fields of endeavour. In 1950 the first national Survey of Municipal Recreation was carried out on a sampling basis by the Council with the assistance and co-operation of the Federation of Mayors and Municipalities and the Parks and Recreation Association. The Council also operates a preview visual-aids library service.

The Act is administered by the Department of National Health and Welfare with the Physical Fitness Division acting as a clearing-house among the provinces for the latest information on fitness, recreation, community centres, physical education, athletics, sports and games, theatre arts and related activities. The Division also acts as a liaison office with national associations and comparable organizations in other countries.

The Federal Government makes available to the provinces on a per capita basis an amount not exceeding \$232,000 annually for the promotion of physical fitness and recreational programs. Financial assistance is given only to those provinces that have signed specific agreements with the Federal Government and to the extent to which they match it dollar for dollar up to the maximum available. At the beginning of 1952, eight provinces and the Northwest Territories were participating in the program.

Subsection 5.—Training Programs

Under the Vocational Training Co-ordination Act of 1942 as amended, the Federal Department of Labour, in co-operation with the Provincial Governments, carries on various training projects. Details of these schemes will be found in Chapter XVIII.

Section 3.—Provincial Programs

Subsection 1.—Mothers' Allowances

All provinces have statutory provision for allowances to enable certain needy mothers to remain at home to care for their dependent children. The total cost of this assistance is paid from provincial funds except in Alberta where a portion of each allowance is charged to the municipality of residence.

Subject to the conditions of eligibility which vary from province to province, the allowances are payable to applicants who are widowed or whose husbands are mentally incapacitated and, except in Alberta, to those whose husbands are physically disabled and unable to support their families. They are also payable, except in Nova Scotia, to deserted wives who meet specified conditions; in several provinces to mothers who have been granted a divorce or legal separation and in some to unmarried mothers. Adoptive mothers and foster mothers are also eligible under certain circumstances. The child or children must be under 16 years of age except in Manitoba where the age limit is 15 years. Provision is made in most provinces to extend payment for a specified period if the child is attending school and five provinces continue to pay allowances on behalf of physically and mentally handicapped children for from two to five years.

In all provinces applicants must satisfy conditions of need and residence but both the amount of outside income and resources allowed and the length of residence required prior to application vary considerably, the latter, for example, from one year in Saskatchewan, Ontario and Newfoundland to five years in Quebec. All provinces require that the applicant be resident at the time of application and that the child or children live with the recipient, and most provinces require that they continue to live in the province while in receipt of an allowance. Nationality is a condition of eligibility in six provinces. The applicant must be a British subject, the wife or widow of a British subject or her child must be a British subject, except in Quebec and New Brunswick, where Canadian citizenship is required.

In each province the Act is administered by public welfare authorities, in most provinces through a Mothers' Allowances Board or Commission which either makes the final decision regarding eligibility and the amount of allowance granted or acts in an advisory capacity. In some provinces local advisory committees are also appointed. Rates of benefit as of January 1952 are given in the following paragraph.

In *Newfoundland*, the maximum allowance for a mother and one child is \$25 a month, with \$5 for each additional child and for a disabled father at home; the maximum for a family is \$50 a month, with supplementary assistance of up to \$20 monthly if necessary for proper care and maintenance. In *Prince Edward Island* a mother with one child may receive up to \$25 a month, with up to \$5 for each additional child; the family maximum is \$50 monthly. In *Nova Scotia* a monthly maximum of \$80 for a family is fixed by Statute; the amount payable to a mother and one child is determined by family need. In *New Brunswick* the family maximum is \$60 a month, with \$27.50 for a mother and one child and \$7.50 for each additional child. Where necessary, an additional \$7.50 may be granted for rent if it is needed and if the allowance is below the family maximum. The maximum allowance in *Quebec* for a mother and one child is \$30 in a district where the population is under 5,000 and \$35 where it is 5,000 or over. An additional \$1 per month is paid for each of the second, third, fourth and fifth children, \$2 for the sixth and seventh, and \$3 for the eighth and subsequent children. An extra \$5 is allowed when the mother is unable to work or when a disabled father is living at home. *Ontario* pays a maximum of \$50 a month for a mother and one child with \$10 for each additional child and for a disabled father at home. A foster mother with one child may receive up to \$24 per month, with two children up to \$48, with \$10 for each additional child. The allowance may be increased up to \$20 a month where need is shown and winter fuel allowance is also paid according to need. The maximum monthly allowance in *Manitoba* for a mother and one child is \$51 per month. An additional \$10 is paid for a child aged one to six years, \$13 for a child seven to 11 years, and \$15 for a child 12 to 14 years; \$17.25 is paid for a disabled father in the home. The family maximum is \$150 plus winter fuel for seven months, with supplementary assistance of up to \$25 in special circumstances. In *Saskatchewan* the maximum allowance for a family is \$75 a month, with \$25 being paid for a mother and one child, \$10 for a second child, \$5 for each subsequent child and \$10 for a disabled father at home. Supplementary assistance under the social aid program may be granted by the local municipality and the costs are shared equally by the Province and the municipality. The allowance in *Alberta* may not exceed \$50 per month for a mother with one child, with \$20 for the second, \$15 for the third and \$10 for each subsequent child. A maximum of \$145 is set for a family with nine or more children. Supplementary aid in the form of public assistance may be granted, where necessary, by the municipality of residence, with the Province reimbursing 60 p.c. of the cost. In *British Columbia* the maximum monthly mothers' allowance is \$42.50 for a mother with one dependent child, and \$7.50 for each additional child and for a disabled father living at home. Supplementation from social allowance funds brings the actual maximum monthly payments to \$60 per month for a mother and one child and \$9.50 for each additional child and for a disabled father living at home. Extra expenditures may be met through social allowance funds, and a nutrition allowance is available for tubercular patients and their families.

and \$64,055 paid as supplementation from social allowances funds in 1950 and 1951, respectively.

Subsection 2.—Welfare Services

The care and protection of neglected and dependent children, care of the aged, social assistance or relief, and other special services outlined in the following summary are governed by provincial legislation, although in many areas responsibility for services rests with municipal or voluntary organizations. While the programs and the methods of financing vary considerably, most provinces share the costs of some or all of the municipal services in organized areas and assume the total cost in unorganized territories. The medical services available to social assistance recipients are described at pp. 232-240. Mothers' allowances are dealt with separately at pp. 269-271, old age assistance at pp. 262-263, and allowances for the blind at pp. 265-267.

Newfoundland.—Provincial welfare services are administered by the Department of Public Welfare through a number of regional welfare offices.

Child Care and Protection.—Child welfare has developed largely as a public service and is administered by the Child Welfare Division. Neglected children, made wards of the Director, are placed in foster or adoptive homes or in institutions. The Department pays for the maintenance of wards, grants subsidies for children admitted to orphanages administered by religious organizations, and contributes towards the cost of educating blind and deaf-mute children in institutions at Halifax, N.S., and Montreal, Que. The Division operates an Infants' Home providing short-term care and, for delinquent children, maintains a Boys' Home and Training School and a Girls' Home and Training School. The Director of Child Welfare is Judge of the Juvenile Court.

Care of the Aged.—The Province maintains a Home for the Aged and Infirm at St. John's and also pays a per diem rate for needy old people in the Salvation Army Home and in approved boarding homes.

Social Assistance.—Under the Dependents' Allowances Act, the Province grants assistance to needy unemployables not eligible for other forms of statutory assistance. Aid for certain needy able-bodied persons is provided under the Health and Public Welfare Act.

Prince Edward Island.—The Department of Health and Welfare is responsible for the administration of provincial welfare services.

Child Care and Protection.—Under the Children's Protection Act, neglected or delinquent children may be placed under the guardianship of the Director of Child Welfare or an approved child welfare agency. The children are placed in foster or adoptive homes, boarding homes or children's institutions under the inspection of the Director. Provincial grants are made to child welfare agencies and to the two private orphanages, one Protestant and one Roman Catholic. Juvenile Courts are under the Attorney General's Department.

Care of the Aged.—The aged and infirm are cared for in the Falconwood Mental Hospital and two provincial infirmaries.

Social Assistance.—The Department provides direct social assistance in rural areas and, by agreement, assumes 50 p.c. of the cost of assistance granted by the City of Charlottetown and the incorporated towns and villages. The Department also operates a province-wide program of financial aid to families where the breadwinner is suffering from tuberculosis and is unable to support the family.

Nova Scotia.—Provincial welfare services are administered by the Department of Public Welfare through a number of regional offices.

Child Care and Protection.—The Child and Family Welfare Branch administers the child protection legislation including the inspection of institutions and the licensing of foster and maternity homes. Neglected children may be made wards of the Director of Child Welfare or of approved Children's Aid Societies. Each Society receives annually a provincial grant of up to \$2,000; a sum equal to 25 p.c. of funds received through private campaigns or from municipalities for general operating expenses; and an additional grant of not less than \$1,000, the maximum determined on a per capita basis. The Province and municipality of residence contribute towards the maintenance of each ward placed in a foster home or institution, unless a court order for support is made against the parents.

The Branch operates the Nova Scotia Training School for mentally defective children and the Nova Scotia School for Boys for juvenile delinquents. It is also responsible for the operation of the six Juvenile Courts and the supervision of their probation staff. The municipality of residence is responsible for the maintenance of children in reformatories although the Province may contribute also if the reformatory complies with specified standards.

Care of the Aged.—The aged are cared for in municipal or county homes, in homes operated by religious or private organizations and in private boarding homes where the municipality of settlement may contribute to the cost of maintenance. Homes for the aged are subject to provincial inspection, but do not receive direct assistance from the Province.

Social Assistance.—Relief to unemployables is a local responsibility.

New Brunswick.—The Department of Health and Social Services administers provincial welfare legislation.

Child Care and Protection.—Responsibility for protection and placement services is largely delegated to Children's Aid Societies throughout the Province. Guardianship of a neglected child may be vested in a Society, the Director of Child Welfare or in the Court. Orphanages are operated by religious, private or, in some cases, municipal organizations. With a few exceptions, boarding homes must be licensed and are subject to the provincial inspection required for all child-caring institutions. The Province and the municipality of residence each contributes towards the maintenance of wards committed to an institution, and the Province also reimburses municipalities for one-half of the cost of maintaining wards placed in foster homes, up to a prescribed maximum. The Department may place blind or deaf-mute children in special schools at Halifax, N.S. Juvenile Courts are under the Attorney-General's Department and delinquent boys may be placed in the Provincial Industrial School for Boys which reports to the Minister of Health and Social Services.

Care of the Aged.—Homes for the aged are operated under municipal, religious, fraternal or private auspices and are subject to provincial inspection but receive no direct financial support from the Province.

Social Assistance.—Relief to unemployables is a local responsibility.

Quebec.—Major responsibility for the administration of provincial welfare measures is shared by the Department of Health and the Department of Social Welfare and Youth. The former administers the Quebec Public Charities Act which embodies the Government's policy of granting subsidies to religious and private institutions where they exist rather than creating public services. Grants are made to these institutions on a per diem basis, with the Province, the municipality of residence, and the institution sharing equally the cost of maintenance of indigent persons admitted for care. The Department of Social Welfare and Youth is responsible for preventive and rehabilitative work among neglected and dependent children and for grants to recreation agencies, in addition to certain important educational functions. Social Welfare Courts are, however, under the jurisdiction of the Department of the Attorney-General.

Child Care and Protection.—Needy or abandoned children are generally cared for in institutions such as orphanages, nurseries and other homes, assisted under the Quebec Public Charities Act, although there is an increasing use of foster homes. However, children who are found by a Social Welfare Court or other Court to be particularly exposed to moral or physical dangers may be admitted to recognized Youth Protection Schools under the Youth Protection Schools Act, 1950. The cost of maintenance in these schools is shared equally by the Province and municipalities of residence. The Social Welfare Courts, which in 1950 replaced Juvenile Courts, have statutory responsibility in connection with child and youth protection and certain other provincial programs and also serve as Family Courts. Children who have been exposed to tuberculosis but who have not been infected are placed with rural families under the supervision of the Department of Health in co-operation with local doctors and clergy.

Care of the Aged.—Institutional care for indigent old people is provided under the Quebec Public Charities Act.

Social Assistance.—Financial aid is not provided to needy families in Quebec but institutional care for indigents is available under the Quebec Public Charities Act. The Department of Colonization operates a program whereby families in need are settled on the land in newly opened districts and granted financial aid until they become self-supporting.

Ontario.—Provincial welfare services are administered by the Department of Public Welfare. The Province may pay 50 p.c. of the administrative costs of welfare units established by municipalities or districts to co-ordinate services.

Child Care and Protection.—Child protection legislation is administered by the Child Welfare Division which supervises the local Children's Aid Societies to which responsibility for the care and protection of neglected and dependent children is delegated. Annual provincial grants to these Societies include token grants based upon the quality and level of services provided, in addition to grants equal to 25 p.c. of the amounts raised through voluntary effort. The Province also reimburses the municipalities of residence in amounts not exceeding 25 p.c. of the net cost of maintaining children made wards of Children's Aid Societies. Children's institutions and day nurseries are supervised by the Child Welfare Division and must be licensed. The Province makes small per diem grants to non-profit-making charitable institutions and pays one-half of the operating and maintenance costs of municipal day nurseries. Juvenile Courts are under the Attorney-General's Department, while training schools for juvenile offenders are operated by the Department of Reform Institutions.

Care of the Aged.—Municipalities are required by law to provide institutional care for the aged, with the Province contributing 50 p.c. of the net operating and maintenance costs and 50 p.c. of the cost of approved new construction. Both public and private institutions are subject to provincial regulations and inspection and, under certain circumstances, charitable institutions may receive a small per diem grant for each needy person maintained.

Social Assistance.—Under the Unemployment Relief Act the Province reimburses municipalities, up to a prescribed maximum, for 50 p.c. of their expenditures on relief to needy unemployables and on incapacitation allowances and rehabilitative measures for single, needy, 'handicapped' residents. In unorganized areas the program is administered and financed by the Department. The Soldiers' Aid Commission extends emergency assistance and advice to former service men and their families.

Manitoba.—The Public Welfare Division of the Department of Health and Public Welfare is generally responsible for provincial welfare services.

Child Care and Protection.—Preventive and protective services for children are provided by four non-denominational Children's Aid Societies in their respective territories. The Public Welfare Division supervises their programs, provides services in other areas and supervises children's institutions. Neglected children may be made wards of the Director of Child Welfare or of a Children's Aid Society. Municipalities are responsible for the maintenance of wards but the Province reimburses them for a portion of these costs from the \$300,000 annual fund distributed among the municipalities in proportion to their relief and child welfare expenditures. Under agreements between the Province and the Children's Aid Societies, payment of annual provincial grants is conditional on the provision of a basic level of service

and the collection of equivalent voluntary contributions; payments are made in accordance with a formula based on the number and cost of social workers per 100,000 population in a representative area where the Division directly administers child-welfare services. The Division provides foster-home care and supervision for mental defectives placed in the custody of the Director of Child Welfare and, with the Division of Psychiatry, operates a home for mentally defective girls. The Attorney-General's Department is responsible for Juvenile Courts and operates a boys' home and a girls' home for delinquents.

Care of the Aged.—Institutions and nursing homes for the aged and infirm are supervised and licensed by the Department under public health legislation.

Social Assistance.—Municipalities are responsible for assistance to needy residents, but these expenses, as well as ward maintenance costs, are partly reimbursed by the Province from the \$300,000 annual social assistance fund which is allocated on a pro-rata basis. The Province is responsible for aid to persons without municipal residence as well as for general assistance in unorganized territory.

Saskatchewan.—The administration of provincial welfare services, under the Department of Social Welfare and Rehabilitation, was reorganized in 1952 to provide for more effective co-ordination and supervision of programs. A single Public Welfare Branch replaced the former Child Welfare, Public Assistance and Welfare Services Branches and three new Branches were set up to deal with research and planning; nursing homes and housing, and with rehabilitation.

Child Care and Protection.—The Department provides welfare services for children throughout most of the Province and supervises the program of the Children's Aid Society at Saskatoon to which certain responsibilities are delegated. Children found to be neglected are, by Court Order, made wards of the Minister and are placed in foster homes, adoptive homes or institutions. A portion of the maintenance costs of wards, except of children born out of wedlock, is paid by the municipality of residence. The Branch operates three institutions for the temporary care of wards.

The Corrections Branch of the Department is responsible for both adult and juvenile correctional services, provides probation and parole services for juvenile delinquents and administers the Saskatchewan Boys' School. Juvenile Courts, reorganized in 1950, consist of an Adjudication Division, under a judge, which determines whether a delinquency has been committed, and a Disposition Division which determines treatment. The latter is composed of a magistrate and the provincial youth guidance authority which also has wide supervisory powers over treatment measures.

Care of the Aged.—The Department operates two homes for the aged and censuses and supervises all privately operated homes. Maintenance, where necessary, may be arranged under the social aid program. The Nursing Homes and Housing Branch is also responsible for planning to meet future needs of the aged and for co-operating with other governmental organizations in the fields of institutional care and housing for the aged.

Social Assistance and Special Services.—The costs of assistance to needy persons are shared equally by the municipalities and the Department, the Province paying the entire cost for transients and for persons in unorganized areas. The Rehabilitation Branch provides training and placement services for the handicapped; one-half

the cost of this training is borne by the Province and one-half by the municipality of residence. It is also responsible for the rehabilitation of minority groups and operates a farm where the Metis—persons of mixed Indian and white stock who do not qualify under the Indian Act—are instructed in modern methods of farming while being paid for their work. Two schools are conducted for Metis children.

Alberta.—The Department of Public Welfare is responsible for the administration of provincial welfare measures.

Child Care and Protection.—The care of children who are made wards of the Government is under the control of the Child Welfare Commission. These children may be placed in foster homes, boarding homes or institutions. Financial responsibility for wards rests with the municipalities of residence but the Province may make grants of up to 60 p.c. of the maintenance costs. The Home Investigating Committee is responsible for the inspection of all homes in which children are given care. Effective July 1, 1952, administration of juvenile delinquency was transferred from the Department of Public Welfare to the Attorney-General's Department.

Care of the Aged.—The Province reimburses municipalities for 50 p.c. of costs incurred for the maintenance of needy, aged or infirm persons in municipally licensed homes. The grants may not exceed a prescribed maximum and are contingent upon the maintenance of certain standards.

Social Assistance.—Municipalities are responsible for assistance to indigent residents but the Province is authorized to make grants to the municipalities of up to 60 p.c. of these assistance costs. The Province pays the total cost of assistance granted to transients and to residents of unorganized districts. Families may be assisted through resettlement on suitable farm lands. The Single Men's Division maintains four hostels to care for unemployable, single, homeless men without municipal domicile. Single ex-service men are cared for at Calgary and Edmonton without being placed in institutions. The Province has also set aside Metis Settlement Areas where settlers have exclusive fishing, hunting and trapping rights and are encouraged to engage in lumbering, agriculture and stock-raising. Educational services are provided and government-operated stores sell goods at cost price.

British Columbia.—The administration of provincial welfare services by the Social Welfare Branch of the Department of Health and Welfare is decentralized through district offices in five regions covering the whole Province. Generalized field service is provided by provincial social workers in the area to which each is assigned. The staff of the Social Welfare Branch is also responsible for welfare services in a number of programs operated by the Health Branch.

Cities and municipalities of over 10,000 population must have their own social welfare departments to administer the social assistance program and to provide case-work services. The Province pays 50 p.c. of the salaries of municipal social workers or, where more than one is needed, matches the municipal appointment for worker. Smaller municipalities may either have their own or amalgamate social welfare departments or may pay for the services of the Social Welfare Branch.

Child Care and Protection.—The Child Welfare Division administers legislation governing the protection of children and provides direct services except at Vancouver and Victoria where it supervises the Children's Aid Societies to which responsibility is largely delegated. Municipalities are responsible for the costs of maintain-

wards, with the Province reimbursing them for 80 p.c. of these expenditures and paying the entire cost for children in unorganized areas. Children's institutions, boarding homes and day nurseries are licensed and supervised. The Division administers the boys' and girls' industrial schools for delinquent children. Family case-work and rehabilitative supervision of boys and girls released from the schools are carried on in co-operation with the Psychiatric Division, the probation service of the Juvenile Courts, which are under the Attorney-General's Department, and with voluntary agencies.

Care of the Aged.—The Province operates the Provincial Home which provides care for aged men, contributes 33 p.c. of the capital cost of construction of municipal homes, and licenses and supervises municipal homes, private institutions and boarding homes. The maintenance of needy residents, where necessary, is shared with the municipalities on an 80-20 basis.

Social Assistance.—The social assistance program administered by the Family Division includes allowances to needy individuals or families, counselling services, occupational training, and boarding and foster-home care. The Province reimburses the municipalities 80 p.c. of the costs of basic social assistance payments to indigent residents and pays 50 p.c. of the increased allowances authorized in 1951.

Subsection 3.—Workmen's Compensation

In all ten provinces, legislation is in force providing for compensation for injury to a workman by accident arising out of and in the course of employment, or by a specified industrial disease. A summary of provincial legislation is given in Chapter XVIII.

Subsection 4.—Care of the Dependent and the Handicapped

Detailed statistics of charitable and benevolent institutions are made available every five years. The results of the 1951 Census in this field, published in mid-summer 1952, may be secured from the Dominion Statistician. Figures for 1946 are given in summary form in the Year Book 1950, p. 288.

PART III.—NATIONAL VOLUNTARY HEALTH AND WELFARE ACTIVITIES

A number of national voluntary agencies carry on important work in the provision of health and welfare services, planning and education. These agencies, some of which are described below, supplement the services of the federal and provincial authorities in many fields and play a leading role in stimulating public awareness of health and welfare needs and in promoting action to meet them.

Canadian Welfare Council.—The Council, established in 1920, is a national association of organizations and individual citizens in partnership to secure comprehensive, well-administered social services of high quality for the Canadian people. It furnishes authoritative information, technical advice and field service in the main areas of social welfare and provides a means of co-operative planning and action by serving as a link between the public and private agencies. Member organizations include community chests and councils, private social agencies, various federal, provincial and municipal departments and other groups and individuals active in the fields of health, welfare and education.

The policies and programs of the Council are determined by its members with the help of a nationally representative elected board of governors. Aided by professional staff, the members work together through divisions of Child Welfare, Family Welfare, Recreation, Public Welfare, Delinquency and Crime, and Community Chests and Councils. Other aspects of social welfare are dealt with by special committees and departments, including the Department of French-speaking Services.

Some subjects to which the Council is giving study are labour, Canadian adoption laws as a step towards improved adoption procedure in all provinces, needs of the aged, public assistance, residence and settlement legislation, rehabilitation of the disabled, health insurance, civil defence, and a large number of surveys on a variety of subjects requested by agencies, communities and provinces. Council publications include the periodicals *Canadian Welfare* and *Bien-être social canadien*, an annual directory of Canadian welfare services, and division bulletins, pamphlets and reports.

Canadian Conference of National Voluntary Health and Welfare Organizations.—The Conference, set up in 1949, provides national health and welfare agencies with a clearing-house and a medium for exchange of experience and for joint study and action with a view to increasing co-operation in matters of common concern.

Canadian Committee of Youth Services.—This Committee, established in June 1949, serves in an advisory capacity to youth groups and provides an opportunity for organizations concerned with youth to meet for discussion of mutual problems.

Canadian National Institute for the Blind.—The Institute, founded in 1918, provides extensive rehabilitative services for blind persons and carries on an active program for the prevention of blindness. Its services include home teaching of touch reading and writing, handicrafts, occupational training and placement welfare services and financial assistance. It operates factories to afford employment for blind men and women and controls tobacco stands, newsstands and industrial cafeterias managed by the sightless. Field services are provided through over 30 district offices staffed by field workers and teachers, most of whom are blind. The Institute maintains a national library of Braille and recorded literature, operates several residences and gives financial support to recreational clubs for blind persons. In the preventive field, it operates eye clinics, arranges treatment and distributes literature. The Institute is supported by Government grants and voluntary subscriptions.

The Canadian Red Cross Society.—The peacetime program of the Society consists of eight major services. The operation of outpost hospitals and of a blood transfusion service are important projects in nearly all provincial divisions. Nutrition and visiting homemaker's services, and instruction in swimming and water safety are carried on in most branch areas. In addition, relief is supplied in times of national and international disaster, craft training and recreational centres are operated for hospitalized war veterans, and a national inquiry bureau traces persons for the purpose of reuniting families and friends.

The Canadian Junior Red Cross promotes health and good citizenship in schoolroom branches across Canada. As part of its program, the Junior Red Cross Crippled Children's Fund is maintained to assist in providing treatment for handicapped children.

The Victorian Order of Nurses for Canada.—The Victorian Order of Nurses is a voluntary public health agency, national in scope and having as its primary object the care of the sick in their own homes. Care is given under medical direction by visiting nurses to medical, surgical and maternity patients, a large percentage of whom would otherwise be without skilled nursing services. Patients are expected to pay the cost of the home visits, but fees are scaled according to family income and service is never refused because of inability to pay.

Part-time nursing service is given in industrial plants where the number of employees does not warrant full-time employment of a nurse. In smaller centres where the Order provides the only public health nurse, the program is usually enlarged to include school nursing, assistance at immunization clinics and child health centres and other public health services.

The Health League of Canada.—The Health League of Canada is a voluntary association devoted to health education. Through the media of press, radio, posters, pamphlets, motion pictures and the public platform, the League keeps the public informed concerning the health value of milk pasteurization, immunization procedures for preventable diseases, proper nutritional habits, sanitary work practices by public food-handlers and organized health programs for industrial workers. The League supplements its year-round program with the annual sponsoring of National Health and National Immunization Weeks.

The Order of St. John.—The primary purpose of the Order is to teach first aid, home nursing, child welfare, sanitation, hygiene and kindred subjects to citizens of Canada irrespective of age, race and creed, and to provide trained and organized personnel to help in time of disaster or national emergency. The Canadian branch was organized in 1895 and, since that time, more than 1,250,000 persons have been trained and have passed examinations in various subjects. The Order has its headquarters and national offices at Ottawa, branches in every province and local centres in hundreds of cities, towns and villages throughout Canada. There are two subsidiary branches, the St. John Ambulance Association and the St. John Ambulance Brigade, the first devoted to teaching and the second to rendering voluntary public assistance as required. A blood-grouping program was started early in 1943 so that compatible donors might be obtained with the least possible delay in emergencies.

The Canadian Arthritis and Rheumatism Society.—The Canadian Arthritis and Rheumatism Society was incorporated in 1948 for the purpose of reducing morbidity and mortality from arthritic and rheumatic diseases. Its objectives include the raising of funds to support research, the education of professional personnel and of the general public, and the promotion and organization of treatment facilities. A Medical Advisory Board composed of leading physicians, surgeons and scientists advises on the research program, professional education and public relations.

Divisions of the Society are operated in British Columbia, Saskatchewan, Manitoba, Ontario and Quebec. The British Columbia Division conducts an out-patient diagnostic service, in-patient care and a mobile unit; the diagnostic service is supplied through arthritis clinics and a mobile unit which brings treatment facilities to those unable to leave home.

The National Cancer Institute of Canada.—The National Cancer Institute was incorporated in 1947 for the purpose of correlating cancer-control activity in Canada and of establishing and maintaining cancer research. Its program includes the sponsorship of research projects through grants-in-aid and fellowships, professional education, the co-ordination of provincial cancer-control programs and the operation of the Canadian Tumour Registry at Ottawa. The Canadian Tumour Registry utilizes the technical facilities of the Laboratory of Hygiene of the Department of National Health and Welfare to diagnose unusual tumours and to act as a central tumour library. The Institute has advisory committees on radiation therapy and on records and statistics.

The Canadian Cancer Society.—This Society, incorporated in 1938, works under a joint director with, and acts as a fund-raising body for, the National Cancer Institute. The Society has branch divisions in nine provinces and these provide services particularly in the fields of lay education and welfare. The services vary from province to province but include assistance from social-service workers and the provision of free cancer dressings and medicines, nursing care, transportation and living accommodation.

The Canadian Tuberculosis Association.—This Association, which was founded in 1900, is active in fund-raising for the purpose of educating the general public in tuberculosis prevention and of sponsoring services for the tuberculous. Services are provided through provincial branches. The Saskatchewan branch operates the provincial tuberculosis-control program in that Province and in several provinces services include assistance in the diagnosis, treatment and rehabilitation of the tuberculous through the operation of mobile X-ray units, the employment of teachers of vocational and academic subjects, and generally through co-operation in tuberculosis-control programs of provincial health departments.

The Canadian Mental Health Association.—The Canadian Mental Health Association operated between the years 1918 and 1950 as the National Committee for Mental Hygiene. The Committee worked for the conservation of mental health; it has studied mental health conditions in Canada and has sponsored mental health projects such as a teacher-training course designed to provide liaison officers between the school and the mental health clinics, and a psychiatric centre for work with social agencies in the community. The Association is continuing and expanding the interests of the Committee through the formation of provincial branches to make consultative and educational services more readily available to the whole population.

Other National Health Organizations.—Additional voluntary agencies are engaged in a variety of health activities including financial support and operation of educational programs, research and training, and the provision of treatment. These activities may be directed towards the general public or towards specific categories of ill or disabled persons, such as the paraplegics. Some organizations, such as those dealing with the blind and the deaf, are interested in the welfare as well as the health problems of the groups served. Organizations of professional medical and related personnel, in particular of public health personnel, assist in the development of agencies and in guiding their activities.

PART IV.—VETERANS HEALTH AND WELFARE SERVICES*

Section 1.—The Department of Veterans Affairs

The great majority of veterans have now been assimilated into civilian life and the work of the Department of Veterans Affairs has settled into a well-defined pattern, its major functions being concerned with medical treatment, payment of pensions and allowances, welfare work and land settlement. The Department maintains 18 District Offices and two Sub-district Offices in Canada as well as District Offices at London, England. The administration of the Veterans' Land Act also requires the maintenance of District and Regional Offices in locations as accessible as possible to veterans. Travelling welfare officers operate from these Offices.

The basis of administration of the Department of Veterans Affairs, established in 1944, is dealt with in the Year Book 1946, pp. 1053-1054. The work of the Department as it developed year by year is outlined in subsequent editions and is brought up to Mar. 31, 1952, in the following sections.

Section 2.—Medical, Dental and Prosthetic Services

Medical Services.—It is the policy of the Department to give the veterans the most modern treatment possible. Wherever a Departmental hospital is situated in proximity to a medical school, close co-operation is maintained between the two. Veterans hospitals are actively engaged in under-graduate and post-graduate teaching, and members of the medical faculties are employed in the hospitals with other specialists. Ten hospitals have received approval by the Royal College of Physicians and Surgeons of Canada for advanced post-graduate teaching in internal medicine and general surgery. Six of these are also approved for advanced post-graduate teaching in specialties. The majority of the consultant staffs at Departmental hospitals are employed on a part-time basis and are also generally engaged in medical teaching.

Professional and other members of the university staffs are employed as consultants and advisers in the same way as medical consultants. Thus, the Department receives expert advice in nursing, pathology, medical social services and other medical sciences.

Special centres for the investigation and treatment of arthritis, paraplegia, tuberculosis, etc., are active in the larger hospitals. Where Departmental facilities are not available, veterans with service-related disabilities receive treatment and hospitalization through the doctor of their choice.

During the year ended Mar. 31, 1952, 105 research projects were submitted to the Advisory Board for Medical Research and Education and, of these, 58 were continuing and 47 were new. These projects included clinical research of the effects of ACTH and Cortisone on various diseases, a follow-up study on Hong Kong prisoners of war, a study on Canadian veterans of World War II and a five-year study of gunshot wounds of the head. In addition, studies were in progress on paraplegia, mental diseases, chronic bronchitis and circulatory diseases. Research information is constantly being exchanged with authorities in the United Kingdom and the United States.

* Contributed by the various Branches of the Department of Veterans Affairs through G. G. Yates, Chief of Information.

At the end of 1951, the Department had in operation 9,785 beds in 19 institutions. Of these, 12 were active treatment hospitals, two were health and occupational centres for convalescents, four were veterans homes and one was a special institution. Statistics of accommodation and movement of patients in these hospitals are given at pp. 250-251.

Dental Services.—The number of dental treatments given during the years ended Mar. 31, 1941-52 were:—

<u>Year ended Mar. 31—</u>		<u>Year ended Mar. 31—</u>	
<i>Treatments</i>		<i>Treatments</i>	
No.		No.	
1941.....	99,590	1947.....	2,700,052
1942.....	73,113	1948.....	1,191,218
1943.....	102,554	1949.....	218,173
1944.....	66,562	1950.....	158,149
1945.....	249,170	1951.....	128,206
1946.....	509,703	1952.....	103,242

Prosthetic Services.—The Prosthetic Services Branch of the Department of Veterans Affairs supplies, by manufacture or procurement, all orthopaedic and surgical appliances prescribed by the Treatment Services Branch. The maintenance and renewal of such prostheses for all eligible cases is also the concern of the Branch. A large modern centre at Sunnybrook Hospital, Toronto, together with 11 district centres in the principal cities, extends the manufacturing, maintenance and fitting service across the country. This system ensures a standardization of parts of major prostheses, a control of quality of supplies and availability of service at all times.

A Research and Development Section at Toronto is constantly at work on improvements and, in co-operation with the manufacturing services, conducts the field-testing of new developments. Close contact is maintained with the National Research Council in Canada and with research committees in the United States and the United Kingdom.

During the year ended Mar. 31, 1952, 60,053 persons were supplied with appliances or accessories, compared with 55,854 during the previous fiscal year. Total issues during these two years numbered 113,530 and 104,936, respectively.

Vetcraft Shops.—The Department operates Vetcraft Shops at Toronto and Montreal as sheltered employment for disabled veterans. These shops manufacture poppy emblems and wreaths for sale by the Canadian Legion on Remembrance Day. An average of 60 veterans are employed. Production value was approximately \$235,600 for the 1951 campaign.

Section 3.—Pensions and Allowances

The Canadian Pension Commission.—The Commission administers the Pension Act and the Civilian War Pensions and Allowances Act and reports to Parliament through the Minister of the Department of Veterans Affairs. The Head Office of the Commission is at Ottawa and representatives, known as Pension Medical Examiners, are located at each District Office of the Department.

It is the responsibility of the Commission to adjudicate upon claims for injury or disease resulting in disability or death during service with the Naval, Army or Air Forces of Canada, and to consider claims for the supplementation of awards to Canadians who suffered disability or death while serving in the Armed Forces of the United Kingdom or its allies in World War I or World War II.

The Pension Act.—Under the Pension Act (R.S.C. 1927, c. 157 and amendments):—

- (1) Pensions payable to veterans of the Fenian Raid and Northwest Rebellion under authority of Orders in Council are supplemented to the Canadian scale.
- (2) Pensions payable by Great Britain on account of Canadians who served in the South African War are supplemented to the Canadian scale.
- (3) Pensions for peacetime service prior to World War I payable under Orders in Council are supplemented to the Canadian scale.
- (4) Pensions are paid to Veterans of World Wars I and II for injury or disease or the aggravation thereof resulting in disability or death attributable to or incurred during service.
- (5) Pensions for peacetime service between World Wars I and II and subsequent thereto are paid when the injury or disease or aggravation thereof resulting in disability or death arose out of or was directly connected with service.
- (6) Special provision is made for the Canadian Army Special Force.

In previous issues of the Year Book information is given regarding the development of Canadian pension legislation and yearly statistics regarding numbers and liability. As at Dec. 31, 1951, pensions in force were as follows:—

<u>Payable</u>	<u>Pensions</u>	<u>Liability</u>
	No.	\$
To dependants.....	33,854	27,195,386
For disability.....	161,085	69,319,818
TOTALS.....	194,939	96,515,204

The basic scale of pensions was increased with effect from Jan. 1, 1952, and it is anticipated that the annual liability will now approximate \$125,000,000. By the 1951 amendments, the pension paid for a total disability to a former member of the forces of the rank of major and below with a wife and two or more children amounts to a personal pension of \$125 monthly, an additional \$45 for his wife, \$20 for the first child, \$15 for the second, and \$12 for each additional child. If he is helpless and in need of attendance, he is granted a Helplessness Allowance, which might vary from a minimum of \$480 to a maximum of \$1,400 per annum depending on the amount of attendance required. In the case of the blind, where the attendance required is not constant, the helplessness award is \$960 per annum.

A pensioned widow receives \$100 per month, with \$40 for the first child, \$30 for the second and \$24 for each additional child. If she remarries, she is granted a gratuity of twelve months' pension, and pension usually continues for her children. Pension for a boy expires when he reaches the age of 16, and for a girl at 17. However, it may be continued to the age of 21 if the child is making satisfactory progress in a course of education approved by the Commission.

Civilian War Pensions and Allowances Act.—This Act extends pension legislation to a number of civilian groups whose work was closely associated with the World War II war effort, including merchant seamen, auxiliary services personnel, the fighters who served in the United Kingdom, special constables with the Royal Canadian Mounted Police, overseas welfare workers, etc.

Veterans' Bureau.—The Veterans' Bureau, staffed by Pensions Advocates, most of whom are lawyers, was established in 1930 to assist those seeking war disability or dependant's pension in presenting their claims to the Canadian Pension Commission (*see* Year Book 1947, p. 1142). This service is also given to persons applying for pension under the Civilian War Pensions and Allowances Act. There are District Pensions Advocates in all District Offices of the Department. The service is free of charge and most applications for pension are handled in this way. At Mar. 31, 1952, the Veterans' Bureau had 6,644 active claims in hand.

Section 4.—Rehabilitation of Veterans

The Veterans Welfare Services Branch of the Department of Veterans Affairs is responsible for the administration of benefits available to discharged members of the Forces under the terms of the Veterans' Rehabilitation Act, the War Service Grants Act, and the Veterans Benefit Act of 1951.

The Department renders assistance to veterans and advises them in social problems through the Social Service Division of the Veterans Welfare Services Branch. At the same time, it does not duplicate any service that is already available to a veteran as a citizen. The rehabilitation of women veterans has been conducted along with that of the male veterans and no particular problems have been encountered.

War Service Grants.—The amounts expended as gratuities under the War Service Grants Act up to Mar. 31, 1952, are shown in Table 1.

1.—Gratuity Payments under the War Service Grants Act, Years Ended Mar. 31, 1945-52

Totals.....	47,170,657	319,330,062	102,941,693	253,497	469,695,909

Re-establishment Credits.—To Mar. 31, 1952, 963,395 veterans re-establishment credit accounts had been opened and 718,890 of these accounts had been closed due to authorization having been given for the complete disposal of the credit. In addition to the \$278,356,263 authorized for use for the purposes listed in Table 2, about \$59,307,000 was written off for veterans who had used the alternative benefit of training, or had made application to settle under the Veterans' Land Act. Of the total re-establishment credit issued to Mar. 31, 1952, more than 78 p.c. was used for homes.

The expenditures made to Mar. 31, 1952, resulted from 1,933,424 individual approved applications for use of the credit.

2.—Re-establishment Credits Paid, by Required Purposes, Years Ended Mar. 31, 1951 and 1952, with Cumulative Totals to Mar. 31, 1952

Casualty Rehabilitation.—The Casualty Welfare Division, the function of which is to provide vocational guidance, assistance in securing suitable employment and vocational after-care, maintains a register of all those veterans whose disabilities in relation to other factors, such as education, previous employment experience and personality, constitute a serious problem in occupational adjustment.

There were, up to Mar. 31, 1952, 36,788 registrations with this Division of which 7,638 were still active cases. The registration according to the type of disability is shown in the following statement:—

Type of Disability	Active Cases	Closed Cases
	No.	No.
Amputation.....	262	1,940
Other muscular and skeleton system disabilities.....	1,776	9,860
Total and partial loss of hearing or sight.....	357	2,303
Neurological cases.....	268	1,034
Heart and vascular system.....	404	2,976
Respiratory disabilities.....	3,308	6,775
Mental and emotional disabilities.....	324	628
Unclassified.....	939	3,634
TOTALS.....	7,638	29,150

Among the national agencies with which the Department is in continuous liaison in connection with casualty welfare are: the Army, Navy and Air Force Veterans Association; the Canadian Legion, B.E.S.L.; the Canadian National Institute for the Blind; the Canadian Paraplegic Association; the Canadian Red Cross Society; the Canadian Tuberculosis Association; the National Society of the Deaf and Hard of Hearing; and War Amputations of Canada.

During the fiscal year ended Mar. 31, 1952, the total number of registrants increased by over 800 cases but the number of active cases decreased by approximately 1,125. Progress in the rehabilitation of the cases between Mar. 31, 1951, and Mar. 31, 1952, was as follows:—

<i>Status</i>	<i>Mar. 31, 1951</i>	<i>Mar. 31, 1952</i>
	No.	No.
Employed.....	28,850	29,991
Unemployed.....	862	786
Receiving treatment, training or other services.....	4,339	3,997
Rehabilitation not feasible.....	1,660	1,874
Unknown.....	191	140
TOTALS.....	35,902	36,788

Rehabilitation of Older Veterans.—The welfare of the older veteran has become firmly established as an important function of the Department of Veterans Affairs. Continuous educational work conducted in co-operation with the Department of Labour and national organizations has created a general awareness of the importance of maintaining the mature, middle-aged worker in gainful productive employment until he reaches an acknowledged retirement age.

The Department's responsibilities in this regard are not lessening with the advancing age of veterans of World War I. Many veterans of World War II have now reached mature age and thousands more will reach this state every succeeding year.

By enlisting support of veterans organizations and other groups, a national chain of voluntary committees has been developed, each accepting local responsibility in co-operation with the Department and the National Employment Service toward their own unemployed older veterans.

Assistance Fund.—Two welfare surveys conducted by the Welfare Service Branch of the Department in the autumn and winter of 1948-49 showed that approximately 21 p.c. of war veterans allowance recipients living in rural areas and 27 p.c. of those living in urban areas were unable to manage on the current allowance. The Assistance Fund was introduced to supplement the allowance in such cases.

District Assistance Fund Committees are established in each District Office of the Department. The District Committee has the responsibility of investigating and adjudicating on each application. Approved applications are paid from the District Treasury Office, thus making funds available to veterans in need as rapidly as possible.

Vocational and University Training.—The vocational training program, authorized under the Veterans' Rehabilitation Act, is dealt with in Chapter XVIII and the university training for veterans program in Chapter VIII.

Rehabilitation Benefits for Members of the Special Force.—The Veterans Benefit Act, 1951, provides for the extension of rehabilitation benefits to ex-members of the Special Force. Persons who enlisted in the Special Force, served in a theatre of operations and were discharged on strength of the Special Force, are eligible for benefits similar to those provided for veterans of World War II. This also applies to members of the reserve and regular forces who served with the Special Force in a theatre of operations subject to certain conditions and time limits respecting commencement and termination of the service performed with the Special Force.

The Veterans' Land Act.—New settlement under the Veterans' Land Act, designed to assist eligible and qualified veterans to settle on farms, small holdings and commercial fishing properties, continued in 1951-52 at a surprisingly high level, 3,887 new accounts being opened of which 2,600 were for small holdings.

Veterans settled in previous years continued to improve their financial positions and integrate themselves into their respective communities. Their payment record was very good, with the exception of those settled in areas where crop failures were reported, and terminations of unfilled contracts, either voluntary or with the consent of Provincial Advisory Boards, were relatively few in number.

During the year, prices of land and buildings, live stock and equipment continued to rise, resulting in increased emphasis being placed on sound appraisals and supervisory work, particularly on behalf of veterans settled on full-time farms, in order to bridge the gap between the capital available to the veteran and the capital required to-day to set up an economic farm unit.

This supervisory work is carried on continuously with the veterans through personal contact by field staff, by field days, demonstrations, evening meetings and through the dissemination of agricultural information material. In this activity the administration enjoys extensive co-operation from federal and provincial agricultural authorities, experimental farms, schools and colleges, from private organizations and associations, commercial companies and successful farmers.

Supervision activity in connection with small holders stressed the utilization of the land available for enterprises likely to return secondary income, and some outstanding successes in this respect have been reported. These veterans were also encouraged and assisted to maintain or increase the value of their properties by building upkeep and landscaping. Evidence indicates that there is a definite relationship between this supervisory activity and the payment record of the veterans.

Table 3 shows the number of veterans who have qualified for settlement, the number for whom financial assistance has been approved, and the amounts approved in the form of loans and grants to these veterans since the legislation was passed.

3.—Summary of Settlement Status, Loans and Grants under the Veterans' Land Act, 1942, as at Mar. 31, 1952¹

Veterans Life Insurance.—The administration and statistics concerning veterans life insurance will be found in Chapter XXVI.

War Veterans' Allowance.—The War Veterans' Allowance Act is administered by the War Veterans' Allowance Board. The allowance provides assistance to veterans with service in a theatre of actual war or who, in lieu of such service are in receipt of a disability pension and have reached the age of 60, or earlier if their physical condition prevents them earning their own living. The allowance may also be paid to the widows of veterans who would themselves have been qualified but in the case of widows it is payable at the age of 55, or earlier if their physical condition makes the allowance necessary. The allowance is not paid as of right but is subject to certain financial tests.

This Act was completely revised during the Sixth Session of the 21st Parliament 1952. The new Act recognizes that many of the older veterans are still able to take light or intermittent employment, and its provisions encourage this by eliminat-

the ceiling on wages for eligible veterans over 60 years during the months in which they are employed and permitting them to receive the allowance during the months in which they may be unemployed.

The maximum rate of an allowance for a single recipient was increased from \$40.41 to \$50 a month, and for a married recipient from \$70.83 to \$90 a month. The permissible income ceiling was raised from \$610 to \$720 a year for a single veteran and from \$1,100 to \$1,200 a year for a married veteran. Where a veteran's wife is blind, the ceiling was raised from \$1,100 to \$1,320 a year.

The previous provision whereby upon the death of a recipient the widow could be granted twelve monthly payments of the amount of the award in payment to him at the time of his death has been changed to permit the payment to the widow of the maximum amount permissible under the Act, i.e., \$90 a month for twelve months. The same provision has been extended in the new Act to the recipient bereft by death of his spouse. This latter provision is entirely new and is designed to assist the veteran recipient in discharging the costs of the last illness and funeral of his wife and his adjustment to single status.

The maximum monthly allowance for orphans has been increased to \$40 for one orphan, \$70 for two orphans, and \$85 for three or more orphans of one veteran. The amount of personal liquid assets that an applicant may have before being granted the allowance is \$1,000 in the case of a single veteran and \$2,000 for a married veteran. In both instances, interest from bonds, etc., up to a maximum of \$25 annually is permitted as exempt income. The permissible value of property which the veteran owns or in which he may have an equity has been raised from \$4,000 to \$6,000. Complete medical and dental treatment by the Department without cost is available.

As at Mar. 31, 1952, there were 37,959 recipients including 8,736 widows. The liability for the year was \$20,945,255.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Section 1.—Canadian Criminal Law and Procedure†

The system under which justice is administered in a State is never rigid. This is neither expedient nor indeed possible. A judicial system must grow and adapt itself to the requirements of the people, and the exact limits of the powers of the different legislative bodies require continued definition by the courts.

The exclusive legislative authority of the Parliament of Canada extends to criminal law throughout Canada. This law is based on the common law of England, built up through the ages and consisting first of customs and usages and later of principles enunciated by generations of judges and introduced into Canada, as regards criminal law, by Royal Proclamation in 1763. For particulars of the Federal judiciaries see Chapter II, pp. 61-63.

The judicial systems of the provinces as they exist to-day are based upon the British North America Act of 1867. Section 91 provides that "the exclusive legislative authority of the Parliament of Canada extends to . . . the criminal law, except the constitution of courts of criminal jurisdiction, but including the procedure in criminal matters". In each province (Sect. 92, ss. 14), the legislature may, exclusively, make laws in relation to "the administration of justice in the province, including the constitution, maintenance and organization of provincial courts, both of civil and of criminal jurisdiction and including procedure in civil matters in those courts". The Parliament of Canada may, however (Sect. 101), establish any additional courts for the better administration of the laws of Canada. For further details of the provincial judiciaries see Year Book 1951, pp. 76-83.

It is frequently difficult to distinguish between "law" and "procedure". Procedure may be interpreted to relate simply to the organic working of the courts, but in a wider sense it may also affect the rights or alter the legal relations arising out of any given set of facts.

* Except as otherwise credited, this Chapter has been revised in the Judicial Section, Health and Welfare Division, Dominion Bureau of Statistics.

† Revised by F. P. Varcoe, Deputy Minister, Department of Justice, Ottawa.

Prior to Confederation, each province had its own criminal jurisprudence and statutes which caused great and increasing inconvenience until the adoption of various consolidation Acts, the chief of which are the Criminal Law and Amendment Acts of 1869 and the Criminal Procedure Act of 1886. These Acts deal exhaustively with procedure in respect of indictable and non-indictable offences, jurisdiction of justices of the peace, juvenile offenders, speedy trials, criminal law, schedules and forms, etc.

Codification of the law of crimes by a Criminal Code Bill, founded on the English draft code of 1880, *Stephen's Digest of Criminal Law*, *Burbidge's Digest of the Canadian Criminal Law*, and on the Canadian statutory law, was introduced by the Minister of Justice, Sir John Thompson, passed both Houses of Parliament and became law July 1, 1893.

The Criminal Code classifies offences as indictable and non-indictable. Indictable offences include all offences which are not punishable by way of summary convictions. A limited few of such offences are triable by magistrates without the consent of the accused, by virtue of Part XVI of the Criminal Code relating to the summary trial of indictable offences. The majority, however, are triable only in the Superior Court of the province with a jury, or by consent of the accused, either under Part XVIII of the Criminal Code relating to the speedy trial of indictable offences, or under Part XVI of the Criminal Code relating to the summary trial of indictable offences. Cases triable by jury without the consent of the accused are: treason, treasonable offences, assaults on the Queen, mutiny, unlawfully obtaining and communicating official information, taking of oath to commit certain crimes, seditious offences, libels on foreign sovereigns, piracy, corruption of officers employed in prosecuting offenders, frauds on the Government, breach of trust by public officers, municipal corruption, selling of appointments to any office, murder, attempt to murder, conspiracy to murder, accessory after the fact to murder, manslaughter, rape, attempt to commit rape, defamatory libel, combination in restraint of trade, conspiring or attempting to commit, or being accessory after the fact to any of the above offences, also bribery or undue influence, personation or other corrupt practice under the Canada Elections Act. Also, when an offence is punishable with imprisonment for a period exceeding five years, the Attorney General may require the charge to be tried by jury.

Capital offences now include levying war, murder, piracy in cases of violence, rape, and treason. This is a drastic modification of the Code as it stood a century and a half ago. For further details of law and procedure see the Year Book 1951, pp. 256-258.

In the Province of Quebec a district magistrate has powers extending beyond those of a magistrate in any other province. He has the same jurisdiction as a county court judge in Ontario and disposes of cases under Part XVIII of the Criminal Code, whereas the jurisdiction of the magistrates of other provinces extends only to Parts XV and XVI of the Criminal Code.

Non-indictable offences include cases usually dealt with summarily by police magistrates and justices of the peace under Part XV of the Criminal Code or under the Provincial Summary Convictions Acts, as the case may be, and comprise breaches of municipal regulations and other minor offences.

The statistics presented in this Chapter are collected directly from the criminal courts in the different judicial districts throughout Canada. There are 157 such districts divided by provinces as follows: Newfoundland 7, Prince Edward Island 3,

Nova Scotia 7, New Brunswick 15, Quebec 23, Ontario 48, Manitoba 6, Saskatchewan 21, Alberta 12, British Columbia 8, Yukon Territory 1 and the Northwest Territories 1.

Although Newfoundland became a Province of Canada on Mar. 31, 1949, and the Criminal Code of Canada was proclaimed in that Province on Aug. 1, 1950, statistics of criminal and other offences and delinquencies will not be available on a uniform basis with those of the other provinces and territories until 1951. The only information presently available regarding Newfoundland is given in Section 4. Data in the other Sections are entirely exclusive of that Province.

Section 2.—Adult Offenders and Convictions

Subsection 1.—Adults Convicted of Indictable Offences

The main interest in criminal statistics is concerned with those persons guilty of the more serious crimes. Such offenders are fewer than those who commit non-indictable offences but, from the standpoint of the protection of society, they are more important.

At a Dominion-Provincial Conference on Criminal Statistics, held in 1949 and attended by representatives of the Provincial Departments of the Attorneys General and the Departments of Health and Welfare, it was recommended that the method of compilation of Canadian criminal statistics be changed to base the statistics of indictable crimes on offenders rather than, as in the past, on convictions, a procedure later approved by the provinces.

This innovation makes impossible any comparisons of the tables in this subsection with those on indictable offences in previous Year Books, but the advantage of obtaining a truer and a more readily understood analysis of persons responsible for serious crimes in Canada outweighs this disadvantage. It is more logical to have details of age, sex, marital status, etc., related to the offenders of crimes rather than to the convictions for crimes. Thus, where any person is prosecuted at the same hearing for several offences, one offence has to be selected for tabulation. The rule followed is to select that for which the proceedings were carried to the furthest stage—to conviction and sentence if the prisoner was tried on several charges; if there are several convictions, the offence selected is that for which the heaviest punishment was awarded; if the final result of proceedings on two or more charges is the same, the most serious offence (as measured by the maximum penalty allowed by the law) appears in the tables. Where a person is prosecuted for one offence and convicted of another (e.g., charged with murder and convicted of manslaughter), the case appears only under the offence of which he is convicted.

In the case of non-indictable offences, the figures given continue to be based on convictions and are comparable with those previously published.

Statistics are for years ended Sept. 30 and include only cases finally determined within the year. Cases not entirely disposed of within the year (e.g., tried but sentence postponed) are held over for the next year's report.

1.—Adults Convicted of Indictable Offences and Ratio per 10,000 Population, 16 Years of Age or Over, by Provinces, Years Ended Sept. 30, 1949 and 1950

¹ Estimates of population 16 years of age or over are not available for the Yukon and Northwest Territories.

Indictable offences are divided into six classes as shown in Table 2. Class I covers crimes against the person. In the period under review the number of offenders in this class was not large, being practically the same in 1950 as in 1949. Over 70 p.c. of the offenders were convicted of such crimes as assaults of various kinds and obstructing police. Nineteen persons were convicted of murder in 1950, seven less than in 1949; 13 of attempted murder; and 75 of manslaughter as against 51 in the preceding year.

Classes II, III, IV and V cover offences against property. Thieves predominate among all other offenders in these classes though the number was slightly lower in 1950 than in 1949. Burglars and robbers whose serious crimes involve acts of violence were the next most numerous and in 1950 increased by 8 p.c. over 1949. The number of persons who maliciously damaged property decreased in 1950 except for those guilty of arson who, though not many, doubled in number.

Miscellaneous offences are listed in Class VI. Reckless and drunken drivers who endanger many lives increased in numbers during 1950, the latter by 17 p.c. There were 356 offenders under the Opium and Narcotic Drug Act, an increase of only three over 1949; 252 of these were males and 300 were convicted of possessing heroin. Of these offenders, 302 or 85 p.c. were born in Canada; British Columbia courts convicted 48 p.c. of the total and Ontario courts 24 p.c.

¹ Offences against females include: abortion, assault against females or wife, indecent assault, carnal knowledge, incest, procuration, rape, attempted rape and seduction.

Table 3 shows that, in 1950, 64.1 p.c. of the persons convicted of indictable offences had not gone beyond elementary school grades in education, 40.6 p.c. were 24 years of age or younger, 11.8 p.c. were 45 years of age or over, and 75.7 p.c. lived in urban centres. Of these offenders, 93.8 p.c. were males; 88.9 p.c. were born in Canada; 55.5 p.c. were unmarried; 26.0 p.c. were recorded as labourers; and 7.1 p.c. had no employment.

Female Offenders.—There were 1,943 female offenders convicted of indictable offences in 1950, 107 more than in 1949 or an increase of 5.8 p.c. New Brunswick, Quebec and Ontario were the only provinces showing decreases. Nearly 44 p.c. of the women convicted in 1950 were found guilty of theft and receiving stolen goods, while 12 p.c. were committed for assault.

Persons with Multiple Convictions.—Table 5 shows the number of persons having more than one conviction at a court appearance for the years 1946-50. Multiple convictions occur most often in cases of forgery and uttering, false pretences, theft, receiving stolen goods and burglary.

5.—Persons Convicted of More than One Offence at the Time of Trial compared with Persons Convicted of One Offence, Years Ended Sept. 30, 1946-50

Disposition of Cases and Recidivism.—Of all suspects before the courts for indictable crimes, 86 p.c. were adjudged guilty in 1950; the convictions against males (86.3 p.c.) constituted a higher percentage than those against females (81.7 p.c.) and varied greatly as between provinces. New Brunswick showed the highest percentage (95.7 p.c.) of convicted persons and Nova Scotia the lowest percentage (74.5 p.c.).

In 1950, 60.2 p.c. of the convicted persons were first offenders, 9.1 p.c. had previously been found guilty of one offence and 20.7 p.c. had two or more earlier convictions. Court records for the remaining 10.0 p.c. were not obtained. These proportions were much the same in 1949 when 57.7 p.c. of those convicted were first offenders, 8.5 p.c. were second offenders and 20.2 p.c. third offenders; information for the remaining 13.6 p.c. was not stated.

Sentences.—The types of sentences were in much the same proportion in 1949 and 1950. In the latter year 29.1 p.c. of persons convicted of indictable crimes were fined; 38.1 p.c. were sent to gaol without option of fine, 6.5 p.c. were committed to reformatories and 6.6 p.c. to penitentiaries, and 19.6 p.c. were given suspended sentence or put on probation. Eighteen males and one female were given the death sentence.

Court Proceedings.—The 1950 figures show that 68.3 p.c. of the persons tried by jury were convicted; speedy trials (by court after waiver of jury trial) brought convictions in 75.1 p.c. of the cases and summary trials by magistrates ended in convictions in 87.3 p.c. of the cases.

Of persons charged on indictment, 90.9 p.c. were tried by magistrate or family court judge, 2.5 p.c. by judge and jury and 6.6 p.c. by judge alone.

Tables 9 and 10 summarize court proceedings for the year ended Sept. 30, 1950.

Subsection 2.—Young Adult Offenders (16-24 Years)

Young men and women from 16 to 24 years of age formed 40.6 p.c. of the criminal population who committed indictable offences in 1950, although they comprise only about 21 p.c. of the total population of 16 years of age or over. As this age group includes some of the most daring offenders and, at the same time, those most likely to profit by education and training, it seems worth while to give consideration to it as distinct from the older and confirmed offender groups.

Over 75 p.c. of the young offenders were tried in three provinces—Ontario (40.8 p.c.), Quebec (22.7 p.c.) and British Columbia (12.5 p.c.). Almost one-half (47.2 p.c.) of them were under 20 years of age.

11.—Young Adult Offenders, by Age Groups and Provinces, Year Ended Sept. 30, 1950

(Exclusive of Newfoundland)

Totals.....	42	553	308	2,899	5,197	677	498	955	1,588	32	12,749

Among all male offenders, the young men aged 16 to 24 years were responsible for 33.4 p.c. of the assaults (including obstructing the police). They represented 55.0 p.c. of the total who attempted and committed rape; 66.5 p.c. of the male robbery and burglary convictions; 44.9 p.c. of those guilty of damage to property without violence, which includes all thefts; 75.5 p.c. of those who stole motor-vehicles; and 42.4 p.c. and 48.4 p.c., respectively, of those who maliciously damaged property and were found with offensive weapons.

Young male offenders within the age groups 16 to 24 years were convicted of 171 more crimes in 1950 than in 1949, an increase of 1.4 p.c. The only classes of crime showing decreases were forgery and uttering and malicious damage to property. Thefts and receiving stolen goods accounted for 41.0 p.c. of the total young male offenders, burglaries and robberies 23.8 p.c., and common and aggravated assault 11 p.c.

Of the total females convicted of indictable offences, 40.1 p.c. fell within this group of young offenders. Over 50 p.c. of the females committed for forgery and uttering were in this group, as were 46 of the 47 women found guilty of offences against public morals.

Young women were convicted of 106 more offences in 1950 than in 1949, an increase of 15.8 p.c. While there was a decided decrease in the number convicted of burglary and robbery in 1950, and a slight decrease in those guilty of malicious damage to property, these decreases did not counterbalance the increases in other classes of offence. Thefts and receiving stolen goods brought over one-half of these young women to court.

20-24 "	6,858	617	..	6,716	606	-2.1

The sentences meted out to these young people varied somewhat from those given to offenders of over 24 years of age. A higher proportion of them in 1950 were given suspended sentence, put on probation or sent to reformatories while a lower proportion were fined or given gaol or penitentiary sentences.

14.—Disposition of Sentences for Indictable Offences, Year Ended Sept. 30, 1950

(Exclusive of Newfoundland)

Death.....	0.2	0.1	—	0.1

Through suspending sentence and probation supervision many of these young offenders received another chance to make good, while reformatory training gave others an opportunity to better their employment possibilities. In this connection it is interesting to note that 34.7 p.c. of the males were recorded as labourers, which indicates that they had no particular skill by which to earn a living; the proportion of male offenders of all ages recorded as labourers was 22.9 p.c. About 6 p.c. of the youths were unemployed and 78.8 p.c. lived in urban centres.

Of the young female offenders, 28.8 p.c. were not gainfully employed; domestic or personal service was the occupation of 39.5 p.c. and 85.1 p.c. lived in urban centres.

Since those convicted of non-indictable offences are not reported by age of offender, it is not possible to segregate young people of 16 to 24 years of age who have had summary convictions.

Subsection 3.—Convictions for Non-indictable Offences

Non-indictable offences—those not expressly made indictable—include all offences against provincial statutes and municipal by-laws. Non-indictable offences are triable by magistrate or justice of the peace under Part XV of the Criminal Code or under the Provincial Summary Conviction Acts as the case may be.

It is debatable how far summary convictions are of a criminal nature and how much their increase indicates an increase in crime. Many are breaches of municipal by-laws and contrary to public safety, health and comfort, but they do not involve violence, cruelty or serious dishonesty as, for example, parking violations or exercising callings without licence. On the other hand, offences as serious as cruelty to animals and contributing to juvenile delinquency are included under this classification and such indictable offences as common assault and driving with ability impaired may be tried on summary conviction.

Summary convictions increased by 20·8 p.c. to 1,183,991 in 1950 from 980,489 in 1949. Increases were general in all provinces except Prince Edward Island, while Ontario and Quebec showed the largest numerical increases.

It should be remembered that, while the Criminal Code undergoes little change over a period of time, the figures for summary convictions are greatly influenced by the customs of the people and by the application and degree of enforcement of municipal regulations. These differ from place to place and from year to year and affect non-indictable offences more than they do indictable crimes.

In 1950, decreases in certain types of offences, such as common assaults, disturbing the peace, gambling, frequenting bawdy houses and operating a radio without a licence, were offset by decided increases in convictions for breaches of traffic regulations, which reached an all time peak, breaches of the Lord's Day Act, which doubled in number, and exercising callings without licence, which were 89·8 p.c. more numerous than in 1949. There were 1,399 convictions for taking a car without the owner's consent in 1950 as against 774 in 1949 and 1,823 convictions for offences against the Unemployment Insurance Act compared to 924 in 1949.

Breaches of Traffic Regulations.—Each year breaches of traffic regulations constitute a greater proportion of the total convictions for non-indictable offences; in 1950 they amounted to 79.3 p.c., an increase of 23.3 p.c. over 1949, which accounted to a great extent for the over-all increase in convictions for all non-indictable offences.

For the year 1950, Ontario with 42.5 p.c. of the registrations of motor-vehicles in Canada had 54.1 p.c. of the total convictions for breaches of traffic regulations; Quebec in the same year had 16.7 p.c. of the motor-vehicles and 24.3 p.c. of the convictions. In interpreting the figures in this way, however, it should be pointed out that traffic regulations are by no means uniform throughout Canada and no account is taken of the differences in the degrees of urbanization in the provinces. The above two provinces have large urban centres, while in provinces with lower degrees of urbanization such as the Maritimes, Saskatchewan and Alberta, convictions are lower when considered in proportion to the number of motor-vehicles registered.

Convictions for Drunkenness and Offences against the Liquor Acts.—In considering Table 18, it should be noted that the same person may and often does appear before the courts on such charges more than once within a year and that the number of convictions may thus be well above the number of persons convicted.

There is general interest in the relation of alcoholism to crime but when examining statistics to support the assumption that some crimes are associated with the consumption of liquor it should be observed that accurate interpretation would necessitate allowance for population variables such as age and sex distribution and other classifications according to social and economic status, etc.

Conviction of Females.—The number of convictions against females for non-indictable offences has increased steadily each year since 1944; the increase in 1950 over 1949 amounted to 32.2 p.c. Only two provinces, Manitoba and Alberta, recorded decreases in 1950 from the previous year. Fewer traffic offences in these two provinces was partly the reason for the decrease, along with a decline in Alberta in cases of vagrancy and common assault, and a reduction in the number of cases of intoxication in Manitoba. British Columbia, Ontario and Quebec showed the largest percentage increases in convictions against females—38.2 p.c., 33.8 p.c., and 40.4 p.c., respectively.

Total traffic offences for which women were responsible increased in 1950 over 1949 by 37.2 p.c. and were the cause for 78.9 p.c. of the summary convictions against them.

Subsection 4.—Appeals

In the calendar year 1950, the Supreme Court of Canada and the Provincial Supreme Courts dealt with 895 appeals of criminal cases as compared with 721 in 1949. The Crown was the appellant in 58 of these cases and the accused in 837 cases. The original conviction or orders were affirmed in 538 cases (60.1 p.c.), sentence was varied or the verdict changed or substituted in 201 cases (22.5 p.c.), 104 convictions (11.6 p.c.) were quashed, and 52 new trials (5.8 p.c.) were ordered.

The returns from the County and District Courts showed that 747 appeals against summary convictions were disposed of in 1950, as against 605 in the previous year. Of that number the informant was the appellant in 75 cases and the accused in 672 cases. The appeals against convictions and orders were dismissed in 430 cases (57.6 p.c.), sentence was varied and the verdict changed or substituted in 116 cases (15.5 p.c.), and there were 201 acquittals (26.9 p.c.). More than a third (38.2 p.c.) of the appeals in all the courts were heard in Ontario, 18.9 p.c. in British Columbia, 15.6 p.c. in Alberta, 9.1 p.c. in Nova Scotia and 7.7 p.c. in Quebec.

Section 3.—Juvenile Delinquents

The Juvenile Delinquents Act defines a child as "any boy or girl apparently or actually under the age of 16 years". Provision is made, however, by which the Governor General in Council may proclaim that, in a province the definition of a child be a "person under the age of 18 years". This has been done in British Columbia, Alberta, Manitoba and Quebec. For uniformity the figures relating to juveniles compiled by the Dominion Bureau of Statistics refer to the younger ages of under 16 years only and deal primarily with cases disposed of by the courts.

In 1950 the practice was abandoned of dividing delinquencies into major and minor offences. This division has always been arbitrary and open to question depending on the standards of behaviour in different communities, as a minor delinquency in one locality may be judged a major delinquency in another.

The fact that juvenile court statistics furnish the most comprehensive figures collected on a country-wide basis makes it important that their possibilities and limitations be understood. This Section gives a picture of juvenile delinquency in Canada from the viewpoint of legal action taken, for in the eyes of the law *a child is a delinquent only when he or she is adjudged before the court to have committed a delinquency*. To many people the term 'juvenile delinquent' has a broader interpretation but that adopted in this Section does not include those boys and girls whose misdemeanours have not been reported to the courts or who have been given the necessary advice and aid from their parents, their school, the police or a child-caring agency. Moreover, it does not include those cases which are handled unofficially by the court, where the judge or probation officer makes an adjustment without filing a legal record of the offence. The tendency to follow this practice and thus keep children's names from court records is growing and may account to some extent for the almost steady decrease in the number of recorded court cases in the past seven years. In 1950 approximately 4,900 cases were disposed of in this way.

These statistics represent cases of delinquency reported to the courts from the most trivial infractions to the most serious, that of murder. The number of cases brought before the courts is influenced by such factors as personnel and facilities of the court, community interest in and understanding of the function of a juvenile court, and by variations in the policies of the courts in the disposition of cases. As more courts are established the additional returns may exaggerate an apparent increase in delinquency or may under-estimate a decrease. In some communities, the juvenile court is the only available agency to provide services to children; in others, there are well-established agencies serving children, of which the juvenile court is only one.

It should be noted, too, that the total figures do not represent the actual number of children charged and found guilty, but rather tend to exaggerate them, for a child referred to the court two or more times during the year for different offences is counted as a different case each time. Neither do they represent the number of offences committed by offenders, as when a child is charged with more than one delinquency at a hearing the most serious offence only is counted.

Reports of juvenile delinquents were received in 1949 from 131 of the 149 judicial districts; the remaining 18 districts reported no offenders. In 1950, reports were submitted by 147 districts. Twenty-nine of these had no cases to report. Separate reports were received in 1950 from 129 incorporated urban centres of 4,000 population or more.

Juveniles before the Courts.—The number of cases of juveniles brought before the courts declined steadily each year from 1943 to 1949. In 1950, according to the reports received by the Dominion Bureau of Statistics, this trend was broken when the cases of 7,304 children were heard for behaviour that was contrary to the law. However, this number, though 266 higher than that for 1949, was the second lowest in the past 25 years.

The rise of 3.8 p.c. in court appearances was accounted for by the Provinces of New Brunswick, Quebec and Ontario. Among the other provinces, Prince Edward Island and Saskatchewan showed the most marked decreases. The effect of the Saskatchewan Correction Act, 1950, may have a bearing on the sharp drop of cases in that Province.

22.—Juveniles brought before the Courts, by Provinces, 1946-50

NOTE.—Statistics for years prior to 1950 are for fiscal years ended Sept. 30. Figures for 1950 are given on a calendar-year basis; for the three months intervening—Oct. 1 to Dec. 31, 1949—see D.B.S. report, *Juvenile Delinquents, 1950*.

The peak in the number of girls appearing before the courts was reached in 1943, a year later than the boys, followed by a decline each year up to 1949. The number of girls appearing in 1950 (756) was higher than that in 1949 but, with this exception, lower than in any year since 1930.

Reasons for Court Appearances.—The number of children adjudged delinquent by the courts of the provinces, exclusive of Newfoundland, in 1950, was 6,418. This was an increase of 220 or 3.5 p.c. over the year 1949.

24.—Juvenile Delinquents, by Provinces, 1941-50

(Exclusive of Newfoundland)

NOTE.—See headnote to Table 22, p. 309.

1950.....	10	351	258	1,369	3,056	400	76	204	688	6	6,418

The greater number of delinquents in 1950 was due partly to an increase in those committing thefts of various kinds (including thefts of money, articles, mail and automobiles), receiving stolen goods, and taking a motor-vehicle without the owner's consent. Theft accounted for the delinquencies of 37.7 p.c. of the boys in 1950, robbery, burglary and breaking and entering for 22.7 p.c., and wilful damaging of property for 11.2 p.c.

Only 2.4 p.c. of the juveniles were judged to be delinquent for offences against the person and over a third of those convictions were for common assault.

The largest percentage of girls (40.7 p.c.) were judged incorrigible; theft was the weakness of 18 p.c., and immorality of 8.8 p.c.

25.—Juvenile Delinquents by Groups of Offences and Ratios per 100,000 Population 7-16 Years of Age, 1941-50

(Exclusive of Newfoundland)

¹ Figures include 852 cases adjourned *sine die*.

Sex and Age of Delinquents.—Juvenile delinquents are predominantly boys. The ratio between boys and girls has remained much the same over a long period and for all offences, in 1950, it was approximately one girl to nine boys.

There were 121 boys of seven and eight years of age found to be delinquent in 1950, though more than one-half of the delinquent boys were 14 and 15 years of age, and 67.3 p.c. were 13 years of age or over.

The ages of 67.5 p.c. of the delinquent girls in 1950 were 14 and 15 years, and 81.7 p.c. were 13 years of age or over. No girls were brought before the courts for delinquencies in Saskatchewan and Prince Edward Island in 1950, and none under the age of 12 in Manitoba and Alberta.

27.—Percentages of Delinquent Boys and Girls, by Age Groups, 1949 and 1950

(Exclusive of Newfoundland)

Totals.....	100.0	100.0	100.0	100.0	100.0	100.0

Education and Employment.—Backwardness in school work may be due to many causes: illness, disturbed family situations, overcrowding in the home or other factors. Presuming that six years is the age for entering Grade I, 48.6 p.c. of the boys and 55.6 p.c. of the girls who were delinquent in 1950 were two years or more below the normal grade for their age, while 3.2 p.c. of the girls and boys were a year or more above it.

Well over one-half of the delinquent boys were in Grades V to VIII, and one-half of the girls had attained Grades VI to VIII, while 12.7 p.c. of the boys and girls were known to have attended high school for some period of time.

In 1950, 13.4 p.c. of the delinquent boys and 23.2 p.c. of the delinquent girls were no longer attending school. Their ages varied and were from 11 years or over but the majority were from 14 to 15 years of age. More than 50 p.c. of these boys and girls had left school from Grades V to VIII.

Nearly a third (31.7 p.c.) of the delinquent boys who had left school were idle. Of those reported as gainfully employed 43.4 p.c. were occupied in transportation and communication concerns or were factory workers, while another 23.1 p.c. were day-labourers.

Of the girls no longer at school, 42.7 p.c. were unemployed and, of those reported as employed, 40.4 p.c. were in domestic service.

Birthplaces of Juvenile Delinquents and their Parents.—Canada was the country of birth of 6,142 or 95.7 p.c. of the juvenile delinquents in 1950. Thirty-four delinquents were born in other Commonwealth countries, 19 in the United States, 29 in Europe and one in China. Ontario was the home province of 68.7 p.c. of the 83 delinquents born outside this country.

Both parents of 69.3 p.c. of the delinquent children in 1950 were born in Canada, while 14.2 p.c. had one parent and 11.8 p.c. had both parents born in other countries. Of those born outside Canada the fathers outnumbered the mothers two to one. To evaluate these figures, comparisons should be made with population ratio of children from 7-16 years of age whose parents were Canadian-born to those whose parents were born elsewhere.

Home Circumstances.—The type of home from which a delinquent comes and the amount and quality of parental supervision he receives are important factors in a child's behaviour. The statistics for the marital status and occupation of the parents, which reflect home conditions, are worth recording though it is impossible to draw definite conclusions from them. For every five juveniles who appeared in court, four lived in an urban centre and one in a rural district. The

parents of 73.4 p.c. of the delinquents were reported as living together in 1950. In the case of 2.4 p.c. of the children, one parent was a stepmother or stepfather. Homes broken by separation of the parents, divorce or death were the background from which 19.9 p.c. of these boys and girls came. The mothers of 8.3 p.c. of the juvenile delinquents were employed other than in the home and, in the case of another 2.7 p.c., the mothers were dead. The fathers of 6.9 p.c. of the cases were deceased.

Source of Complaint.—Not all economic, social and racial groups commonly use the services of a court; nevertheless, some parents do turn to the court for advice and assistance in handling difficult children. In the case of 6.5 p.c. of the children brought to court in 1950, the complaint was laid by a parent or relative, but by far the largest proportion (70.2 p.c.) of charges were laid by the police. School authorities instigated 4.6 p.c. of the complaints, probation officers another 5.2 p.c., other persons 5.1 p.c. and the source of 8.4 p.c. was not stated.

Repeaters.—Experience, which dispels or increases resentment to authority, may be a factor in encouraging or deterring repeaters. Some of the responsibility for the attitude that is built up, be it good or bad, rests with the police, the probation officer, the staff of the detention home and the judge. The recollection of how he was picked up the first time, how he was handled while awaiting hearing, the opinion of those in whose care he was placed during the process of readjustment, all make an impression on a child.

Over the ten-year period, 1941-50, approximately one in every four children brought before the court failed to heed the first warning and made at least a second appearance. In 1950, 78.5 p.c. of the delinquent children appeared before the court for the first time, 13.9 p.c. were second offenders, 4.9 p.c. third, while 2.7 p.c. were dealt with by the courts four or more times.

1950 ¹	6,418	5,039	892	314	140	33	1,379	21.5

¹ Includes minor offences.

Disposition of Cases.—The disposition of cases by the various courts depends on the practices within the courts and on the facilities for court supervision, for institutional care and other services for delinquent children. In 1950, 92.4 p.c. of

all juvenile cases were heard by judges of juvenile courts and the remainder by magistrates or justices of the peace. Only 2.7 p.c. of the cases were dismissed, showing that most complaints were justified.

Some courts consider children whose cases are adjourned *sine die* as delinquent, but others do not. For the sake of uniformity, the latter point of view is maintained by the Dominion Bureau of Statistics. And yet, in estimating the total problem of juvenile delinquency, cases adjourned *sine die* have to be taken into account, for when the number of cases dealt with in this way increases the number of those declared delinquent decreases, as seen by Table 30 which shows proportionately the disposition of cases at five-year intervals from 1925 to 1950.

In the past decade, the dispositions of cases have gradually increased in severity (with the exception of 1950), as shown in Table 31. As the years progressed, a greater proportion of delinquents, or their parents, were fined or asked to make restitution for damages and losses. Training schools received a larger share of commitments, while in fewer cases the final disposition was suspended or the child merely reprimanded. However, corporal punishment was resorted to in appreciably fewer cases—in 1950 only three boys were strapped.

With the present-day interest in probation as a means of giving guidance and control, preferably in the child's own home in order to conserve and strengthen the family ties where possible, it is interesting to note that the number of cases handled in this way has remained fairly constant.

31.—Disposition of Delinquents, by Types of Sentence, 1941-50

(Exclusive of Newfoundland)

Section 4.—Crime and Delinquency in Newfoundland

The Criminal Code of Canada was proclaimed in Newfoundland Aug. 1, 1950. Statistics of criminal and other offences and delinquencies will be uniform with those of other provinces in 1951 and will appear in the report for that year. Legislation has been passed establishing district courts, and magistrates have been appointed in the seven judicial districts of Grand Falls-White Bay, Bonavista-Twillingate, Trinity-Conception, St. John's East, St. John's West, Burin Burgeo and Humber-St. George's.

The city of St. John's is policed by the Newfoundland Constabulary. On Aug. 1, 1950, the Royal Canadian Mounted Police took over the policing of the remainder of the Province, including Labrador, and absorbed into their force about 60 Rangers who previously had patrolled the rural areas under the Newfoundland Department of Natural Resources.

Juvenile Delinquency.—The following extracts from the Report of the Judge of the St. John's Juvenile Court for the year ended Mar. 31, 1950, give some idea of the problem of juvenile delinquency in that Province.

"During the year complaints of delinquency were made in 127 cases (117 boys and 10 girls) in this Court as compared with 147 for the preceding year. . . . The chief offences which brought the juvenile boys into court were stealing, breaking and entering with stealing, damage to property, and truancy, while the complaints against the girls were mainly for assault and theft.

"The number of cases dealt with in a more or less formal manner has again shown a decrease. The probable reasons are as follows:

- (a) Commitments to the care and custody of the Director of Child Welfare of children from homes in which they could not receive even the semblance of proper guidance and their removal by him have prevented other children in the neighbourhood from being led along a course of behaviour unacceptable to society;
- (b) more guidance has been given by the Juvenile Court to children and their guardians as soon as its attention is focused on their behaviour in one way or another;
- (c) the Probation Officers of the Court have followed up and given friendly advice when the need was made apparent to them;
- (d) the efforts of the Domestic Workers of the Division of Child Welfare over recent years are beginning to show effects During the year the Worker dealt with the cases of 17 girls, achieving considerable success without actual court action.
- (e) the growth of improved community services, such as clubs, camps, brigades, etc.

"It is particularly gratifying to note that the number of complaints of damage to property was less than one-half that of last year.

"Probation continued to be the most common disposition of the court and in many cases where complaints were dismissed or disposed of by suspended sentence the court recommended that a friendly interest be shown in the child's activities for a certain period.

" . . . About 74 p.c. of juveniles appearing in court were from one to six grades below the normal [school] grade for their respective ages."

Section 5.—Police Forces

The Police Forces operating in Canada are organized under three groups. (1) the Federal Force, which is the Royal Canadian Mounted Police and whose operations cover a very wide field in addition to purely police work; (2) Provincial Police Forces—the Provinces of Ontario and Quebec have organized their own Provincial Forces, but the other provinces engage the services of the Royal Canadian Mounted Police to perform parallel functions within their boundaries; (3) Municipal Police—every city of reasonable size employs its own police organization which is paid for by the local taxpayers and which attends to purely police matters within the borders of the municipality concerned.

Subsection 1.—The Royal Canadian Mounted Police*

The Royal Canadian Mounted Police is a Civil Force maintained by the Federal Government. It was organized in 1873 as the North West Mounted Police, whose duties were confined to what was then known as the North West Territories. By 1904, the work of the Force received signal recognition when the prefix "Royal" was bestowed upon it by King Edward VII. In 1905, when Alberta and Saskatchewan were constituted Provinces, an arrangement was made whereby the Force continued to discharge its duties as formerly, each province making a contribution towards defraying the cost. This was continued until 1917.

In 1918, the Royal North West Mounted Police was assigned the duty of enforcing Dominion legislation for the whole of Canada west of Port Arthur and Fort William. Soon after the end of World War I an extension of governmental

* Revised by Commissioner L. H. Nicholson, M.B.E., of the Royal Canadian Mounted Police.

activities made it obvious that the enforcement of Dominion statutes throughout Canada must be the responsibility of a Dominion Force and, therefore, the jurisdiction of the Royal North West Mounted Police was extended to the whole of Canada early in 1920. In that year, the name of the Force was changed to the Royal Canadian Mounted Police and the former Dominion Police with Headquarters at Ottawa, whose duties were largely connected with guarding public buildings in that city and the Canadian Government dockyards at Halifax, N.S., and Esquimalt, B.C., were absorbed by the Royal Canadian Mounted Police.

Organization.—The Force is controlled and administered by a Minister of the Crown (the Minister of Justice). Its Commissioner has the rank and status of a Deputy Minister. Officers are commissioned by the Crown and for many years have been selected from serving non-commissioned officers. The Force is divided into 15 Divisions, including the Marine Division with Headquarters at Halifax, N.S. There are 602 detachments distributed over the entire country. Its land force transportation consists of 1,023 motor-vehicles, most of which are fitted with two-way radio sets connecting with wireless stations operated by the Force. Such stations operate in both Western and Eastern Canada, including the Quebec-United States boundary area. The Aviation Section of the Force operates eight aircraft of various types. The present (Mar. 31, 1952) strength of the Force is approximately 4,517 officers and men, with a reserve strength of about 342. The reserve strength is located chiefly in the larger cities where men can be congregated easily and where instruction can be given in the evenings.

The Marine Division has a total strength of 203 officers and men and operates 26 ships of various kinds, the majority of which are located on the Atlantic Coast and on the Great Lakes. The R.C.M.P. schooner *St. Roch*, which has been used as a floating detachment in the Far North and as a supply ship to isolated detachments, is the only ship to navigate the Northwest Passage from east to west and from west to east. It was recently transferred from Esquimalt, B.C., to Halifax, N.S., via the Panama Canal, the only vessel to have circumnavigated the North American Continent.

The Personnel Branch of the R.C.M.P. has officers in each Division across the country. Great care is taken in the selection of recruits.

Duties.—The Royal Canadian Mounted Police has the responsibility for enforcing federal laws throughout Canada and is specially empowered to deal with infractions against smuggling by sea, land and air. It also enforces the provisions of the Excise Act, and is responsible for the suppression of traffic in narcotic drugs. In all, the Force has responsibility in over 50 Federal Government Acts including the Indian Act. It also assists many departments of the Federal Government in administrative duties and is responsible for the protection of government buildings and property. It is the sole police force operating in the Northwest and Yukon Territories. Furthermore, it undertakes secret and security services for the Federal Government. In addition to its federal duties, agreements have been made with the Provinces of Alberta, Saskatchewan, Manitoba, Nova Scotia, New Brunswick, Prince Edward Island, Newfoundland and British Columbia whereby the services of the Royal Canadian Mounted Police can be secured to enforce provincial laws and the Criminal Code in rural districts upon payment for such services. The agreement with Saskatchewan has been in existence for 23 years and those with the

Provinces of Alberta, Manitoba, New Brunswick, Nova Scotia and Prince Edward Island for 19 years. The agreements were entered into with the Provinces of Newfoundland and British Columbia in August 1950, and the police forces of those provinces were absorbed by the Royal Canadian Mounted Police. The Force has agreements also for policing more than 120 urban centres within the provinces mentioned.

Other Services.—The services of R.C.M.P. experts in fingerprints, crime-index information, examination of firearms and questioned documents are available to all other police forces in Canada. A *Police Gazette*, issued monthly and containing instructional articles on police work as well as the latest information on persons wanted and missing persons, is sent to all police forces across the country. The R.C.M.P. has two Police Colleges which are open to selected personnel from other police forces in Canada and to a more limited number of those outside its boundaries.

In recent years the Force has given special attention to crime prevention, as well as detection, and has done much to assist the youth of Canada in developing a healthful outlook towards the police, law, order and responsible citizenship. Personal contacts with over a million young people have been made through school and youth groups supervised by churches and service clubs.

A book entitled *Law and Order in Canadian Democracy*, containing twenty essays has been issued by the Force and is available through the Queen's Printer, Ottawa.

Subsection 2.—Provincial Police Forces*

Quebec Provincial Police Force.—The Quebec Provincial Police Force is responsible for upholding law and order over the whole territory of the Province from the provincial boundary between Ontario and Quebec to the Magdalen Islands in the Gulf of St. Lawrence.

This Force, composed of about 800 men, is in charge of a Director, who acts under direct orders from and is responsible to the Attorney-General of the Province.

To facilitate operations, the territory is divided into two almost equal parts designated as the District of Montreal and the District of Quebec. The Director has his office at Montreal and an Assistant Director at the city of Quebec. Working under these Directors are two Deputies and an Inspector General.

In each District the Police Force is divided into three sections: the detective corps, the constabulary and the traffic officers; each section is in charge of a captain supported by a number of lieutenants and sergeants. This Police Force, which has enjoyed an enviable reputation for the successful policing of Quebec's highways and for its efficiency in solving crimes, has been in course of reorganization for the past three years. During this time, the highway motorcycle patrol has been gradually replaced by a fleet of automobiles which have proved much more efficient especially during the winter months.

* Revised by Geo. A. Shea, O.B.E., Secretary-Treasurer, Chief Constables' Association of Canada

A province-wide frequency modulation radio-communication system has been established at Montreal. A main station, operating on the top of Mount Royal, directs radio-equipped cars within a radius of between 60 and 80 miles around Montreal, and similar stations operating from the cities of Quebec and Three Rivers direct the mobile units operating in their respective areas. Substations operate at each of the eight bridges giving access to or exit from the city of Montreal and a number of cars, all equipped with frequency modulation three-way radio units, patrol the surrounding country day and night.

Ontario Provincial Police.—The Ontario Provincial Police is maintained by the Government of the Province of Ontario under the Attorney-General's Department. The Force is responsible for law enforcement in the rural and unorganized parts of the Province, and in certain municipalities by contract.

The development of the Force from its beginnings in the early years of Confederation to passing of the Police Act, 1946, is outlined in the 1950 Year Book, pp. 332-333.

The Force, with a strength of approximately 1,167 in 1951, consists of a General Headquarters at Toronto and 16 Districts with headquarters at Chatham, London, Dundas, Niagara Falls, Aurora, Mount Forest, Barrie, Peterborough, Belleville, Perth, Cornwall, Haileybury, Sudbury, Cochrane, Port Arthur and Kenora. Each District has detachments adequate to meet law-enforcement requirements. A Criminal Investigation Branch of the Force, under the command of a Chief Inspector, is maintained at Toronto. This Branch investigates crimes of a major nature. The installation of one of the largest police frequency-modulation radio systems in the world has placed at the command of the police a most efficient method of combating every type of lawlessness.

There are in operation 49 fixed stations and 370 two-way radio cruisers. The 250-watt stations at District Headquarters are open 24 hours daily and many of the cars are on continuous round-the-clock patrols.

Up to July 1951, 92 municipalities had availed themselves of the provisions of the Police Act for the policing of their municipalities by the Ontario Provincial Police.

Subsection 3.—Municipal Police Statistics

Police Statistics were submitted for the year 1950 by Chiefs of Police in 205 urban centres, 13 district communities and two unorganized districts of 4,000 population or over. For the first time the statistics are included of the Newfoundland Constabulary, who police the city of St. John's.

The population figures used in table 32 are those of the 1941 census, except where otherwise designated. They are lower than the 1950 estimated population by as much as 1 p.c. in Prince Edward Island to 16 p.c. in Ontario. Any attempt herefore to determine the number of police per population would result in an over-estimation.

Section 6.—Penitentiaries and Reformatories

Penal institutions may be classified under four headings: (1) penitentiaries, with slow turnover since prisoners have long sentences; (2) reformatories, also with rather slow turnover; (3) common gaols, where the turnover is extremely rapid; and (4) training schools, where pupils have the advantage of long educational periods. If the average population for the year be taken as the average of the figures for inmates at the beginning and at the end of the year, and the number discharged as the turnover, the turnover in the years 1949 and 1950 was: in penitentiaries, 50 and 44 p.c.; in reformatories, 390 and 286 p.c.; in gaols, no less than 1,628 and 1,458 p.c.; and in training schools, 90 and 71 p.c., respectively. In considering these figures it should be borne in mind that the common gaol population changes from day to day and is made up partly of accused persons awaiting trial who may be either liberated or sent to a penitentiary or reformatory.

¹ Changes in reporting of the following items were made in 1950: Penitentiaries—Newfoundland Penitentiary reported for the first time; Reformatories for Men—Oakalla Prison Farm previously classed as a reformatory changed to a gaol; and Training Schools statistics are given on fiscal-year basis, Apr. 1-Mar. 31, instead of Oct. 1-Sept. 31 as previously submitted.

Subsection 1.—Penitentiaries*

The Penitentiaries Branch of the Department of Justice is charged with the administration of the various penitentiaries of Canada. Seven institutions are included in the system, the two largest of which are at Kingston, Ont., and St. Vincent de Paul, Que. The other five are at Dorchester, N.B.; Prince Albert, Sask.; Stony Mountain, Man.; New Westminster, B.C.; and Collins Bay, Ont. While the penitentiary at St. John's, Nfld., is operated by provincial authority, the figures for inmates serving two-year or longer sentences are included for 1950 and 1951 in the following tables. During the year ended Mar. 31, 1951, the average daily population of these institutions was 4,700 and the total net cash outlay for the year was \$6,121,254 or \$3.57 per convict per diem, compared with 3,028 average daily population and \$2,689,059 total cash outlay or \$2.43 per convict per diem for 1941.

Females given penitentiary sentences in the different provinces are sent to the penitentiary at Kingston, Ont., where special quarters and staff are maintained for their detention and supervision. Female convicts in custody on Mar. 31, 1951, numbered 104 compared with 46 in 1941.

*Revised by the Commissioner of Penitentiaries, Department of Justice, Ottawa.

The Ticket-of-Leave System.—The parole system in Canada is legalized under the Ticket-of-Leave Act (R.S.C. 1927, c. 107) and is administered by the Minister of Justice. It is described in detail in the Year Book 1948-49, pp. 305-308.

Subsection 2.—Reformatories and Training Schools

A census of reformatories and training schools is taken at five-year intervals, the latest being for June 1, 1951. At that date there were 13 reformatory and corrective institutions of which four were for women and 26 training and industrial schools, 12 of which were for girls. Details regarding the inmates or pupils of these institutions were not available at the time of going to press.

Reports on movement of population are received yearly from penal institutions and training schools. These figures are given for the years 1947-50 in Table 33, pp. 322-323.

PART I.—FORMAL EDUCATION*

Section 1.—Education in the Provinces

Education in Canada is the responsibility of the provinces. Each province has its own system, that of Quebec being a dual one. However, there are two clearly defined types: (1) the English tradition carried on in nine provinces and in the Protestant schools of Quebec and (2) the French tradition followed in the Roman Catholic schools of Quebec.

The English Tradition.—The system of education in each province is established by legislation and administered by a Department of the Provincial Government under a Minister of Education who is a member of the Cabinet and is responsible to the Legislature.

Each of the Atlantic Provinces has a Council of Public Instruction or Board of Education, an advisory group composed of the Premier, Minister of Education, Deputy Minister or Superintendent and certain other appointees. The Council in Newfoundland is made up of the Minister, the Deputy Minister and a Superintendent of Education for each of the four leading religious denominations.

Each Department of Education is concerned with the general administration of the public schools, the conduct of examinations, the certification of teachers, the registration of private schools and trade schools, public and travelling libraries, correspondence courses and also the direct management and control of teacher-training schools, vocational institutes and schools for the blind and the deaf.

* Except where otherwise indicated, this Part has been prepared in the Education Division, Dominion Bureau of Statistics.

Direct control and operation of the public schools is in the hands of local boards of school trustees, usually elected for terms of two or three years. They employ the teachers and administer the revenues received from provincial grants, local taxation and other minor sources. Any fees charged are for secondary education and are merely nominal except in Newfoundland where they take the place of taxation.

Elementary and secondary education extends over 12 or 13 years or grades depending on the province. The elementary grades terminate with Grade VIII and the secondary grades begin with Grade IX though there is a practical as well as a theoretical separation into three divisions: Primary (Grades 1 to VI); Intermediate (Grades VII to X); and Senior (Grades XI and XII or XIII). The elementary schools are known as public schools, the secondary schools as high schools. However, many public schools teach some secondary grades and in Prince Edward Island and Newfoundland all grades are taught in the public schools.

In the cities and in some smaller centres there are kindergarten classes for five-year-olds and a few for four-year-olds as part of elementary education. Most children begin Grade I at age six or early seven and many complete the eight grades in seven years. Attendance is compulsory from age seven or eight to age 14 with attendance to age 16 required of urban pupils in some provinces. Emphasis is on the fundamental subjects—reading, writing, arithmetic, health and social studies—with varying additions of science, arts and crafts, music, home economics and shopwork. Many pupils, particularly in rural areas, leave school at the end of elementary schooling and enter employment in agriculture or unskilled occupations.

Secondary education may extend over a period of four or five years. Courses and subjects of study are diversified. A student may choose the academic course leading to university entrance or select courses or subjects preparing for employment in agriculture, commerce or industry. A student may pass from secondary school into commerce or industry at any time during this period provided he or she is over the compulsory age limit.

Further training is open to the high-school graduate through normal school training of one year for elementary school teachers; specialized technical training extending up to two years in a technical institute—there is at least one such institute in every province; nurse-training school where training extends over three years; or university. University courses are available in all branches of arts, commerce, science, education, philosophy, medicine, theology, etc. Graduation with a first degree (B.A., B.Sc., etc.) requires four years, medicine requires six years and theology seven years. Post-graduate courses require another two or more years.

The French Tradition.—The Quebec Department of Public Instruction is represented in the Cabinet by the Provincial Secretary. Although the Superintendent of Public Instruction is the head of the Department, a Roman Catholic Committee and a Protestant Committee, in charge of the education of Roman Catholics and Protestants, respectively, constitute the Council of Education which formulates policy and superintends the administration of all educational matters. The Council, however, has no authority over many special and technical schools that come directly under various Government Departments. The Protestant schools follow the English tradition already described; the Roman Catholic schools follow the French tradition.

From the very beginning boys are separated from girls. Both sexes follow through the Primary Grades, I to VII. The girls may then take the Intermediate Grades, VIII and IX, and thence enter a regional household science school, begin a four-year course in normal school or enter a superior school where a two-year course leads to a school of fine arts, a commercial course or a nurse-training course.

At the end of the fifth year a boy may enter a classical college for an eight-year course ending with a baccalaureate degree which is prerequisite for entrance to a professional course in university or he may continue on to the end of the primary course and then spend two years in the complementary course. From this point he may enter a technical school or any one of four sections of the two-year superior course—commercial, scientific, agriculture, technical or pre-normal school. The latter leads to entrance to a normal school, the others lead to specialized schools and advanced courses in technical schools or, after another year of preparatory work, to the higher schools of applied science, commerce and agriculture affiliated with the universities.

The boy who neither enters the classical college nor goes on to the complementary course may go directly from the primary course to a trade school or one of the regional agriculture schools. These schools offer two-year terminal courses.

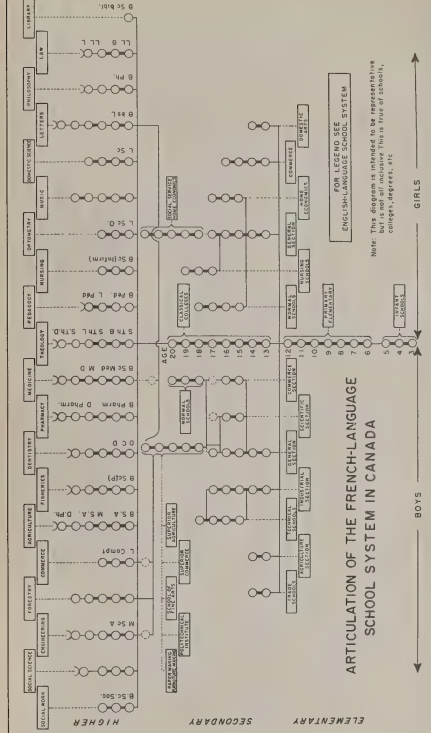

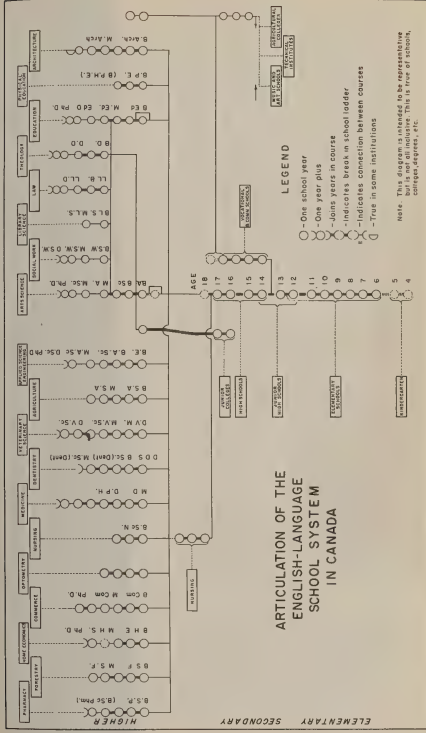

Section 2.—Education in the Territories

The Northwest Territories.—Education in the Northwest Territories is carried on under authority of the Northwest Territories Act and the Ordinances thereunder and the Indian Act and the Regulations thereunder. The Territorial Government operates day schools at Fort Smith, Hay River, Fort Resolution and Fort Simpson for the education of Whites and those of mixed blood residing in the Northwest Territories. The Indian Affairs Branch of the Department of Citizenship and Immigration operates day schools for Indians at Fort Norman, Fort McPherson, Arctic Red River, Fort Franklin, Fort Rae, Rocher River and Fort Good Hope.

For the education of Eskimos, day schools are operated by the Northern Administration and Lands Branch of the Department of Resources and Development at Aklavik, Tuktoyaktuk, Coppermine, Chesterfield Inlet, Cape Dorset and Coral Harbour, N.W.T., and at Fort Chimo and Port Harrison in the Province of Quebec.

Mission residential schools are operated by the Roman Catholic Church at Aklavik, Fort Providence and Fort Resolution, and Mission day schools at Fort Simpson and Fort Smith; the Church of England operates a residential school at Aklavik. These churches and other mission organizations also conduct schools for Eskimos at a number of points in the Eastern Arctic and northern Quebec. Eldorado Mining and Refining (1944) Limited at Port Radium and the Discovery Yellowknife Mines of the Mackenzie District also operate day schools.

The only organized school districts are the Yellowknife Public School District No. 1 and the Yellowknife Roman Catholic Separate School District No. 2. The Public School District, established in 1939, operates a modern eleven-classroom elementary and high school which was opened in 1947. The Separate School District was established in 1951 and has under consideration the erection of a four-classroom school. Meanwhile provision has been made for the attendance of the pupils of this District at the public school.

CANADIAN EDUCATION DIAGRAMS

CANADA has developed two distinct education systems, the French-language system of Quebec, and the English-language system found in the other provinces and in Quebec for the English-speaking minority. The English-language system is generally co-educational, while the French-language system provides distinct, though parallel systems for boys and girls. The philosophy behind both organizations is unique, and breaks in the education ladder occur at different ages.

The two diagrams are designed to illustrate these systems, showing the stages and number of years usually spent in each type of school. Alternate paths are shown at the secondary level leading to higher units or to occupations.

High school teachers using these diagrams for counselling purposes must bear in mind that while they are generally applicable, pupils should check with individual institutions to discover courses offered and years of study required for each. Not all institutions offer higher degrees. Omitted from the diagrams are courses in journalism, public administration, occupational therapy, etc., mainly due to lack of space but, in part, because they may be offered under Arts, Commerce, etc.

Territorial, Federal and Indian day schools are maintained by the authorities concerned and residential, mission, mine, public and separate schools receive aid in the form of grants or supplies from the government authorities concerned. A Superintendent of Education, with headquarters at Fort Smith, periodically inspects the schools of the Mackenzie District. These schools follow the program of studies for elementary and secondary schools authorized by the Alberta Department of Education. In remote areas, elementary and high-school students have access to correspondence-course studies issued by the educational authorities of Alberta and the cost is borne by the territorial administration.

A modified elementary-school curriculum is followed by some of the Federal schools for Eskimos by way of meeting the unique needs in the Arctic regions and a suitable curriculum for teaching Eskimo children in Mission schools is being considered. Because of their nomadic way of life Eskimos seldom remain long at the settlements and the periods available to the Missions for teaching the children are comparatively short. The Eskimos of the Eastern Arctic have long had a system of syllabic writing (expressed as geometric phonetic characters) which most of them can now read and write proficiently. Syllabic writing has been used successfully to provide educational material in the Eskimo language on health matters, hygiene, and native economics for the benefit of both children and adults. It is hoped that the establishment of schools in Eskimo territory will be influential in teaching the Eskimos to understand, speak and read simple English.

A program designed to improve education and welfare facilities generally has been initiated in the Northwest Territories. The program includes regular distribution of educational films, special radio broadcasts to classrooms, the provision of additional equipment and supplies, and increased attention to methods of instruction. Schools are usually staffed by a particular classification of welfare teachers, who carry on welfare work in the communities in addition to regular teaching duties.

Yukon Territory.—Public schools in Yukon are operated by the Territorial Government at Dawson, Mayo, Whitehorse, Carcross, Teslin, Watson Lake, Haines Junction, Kluane Lake, Brook's Brook, Destruction Bay and Swift River. The Roman Catholic Church operates a day school at Dawson and a residential school at Whitehorse.

The education of native children is carried on in day schools operated by the Indian Affairs Branch of the Department of Citizenship and Immigration and in residential schools operated by religious denominations. Full-time day schools are maintained at Whitehorse, Carmacks, Mayo, Moosehide and Old Crow, and seasonal schools at Burwash Landing, Ross River and at other points as required. A residential school is conducted under the auspices of the Church of England at Carcross. Close to the southern boundary of Yukon Territory at Lower Post in British Columbia, an Indian residential school is conducted under the auspices of the Roman Catholic Church. Residential schools in Yukon receive a per capita grant for Indian children registered therein.

The schools in the Territory follow the program of studies of the British Columbia Department of Education. The public schools at Dawson and Whitehorse have high-school departments providing education leading to university entrance. University entrance (junior matriculation) examinations are held in June at Dawson and Whitehorse by authority of the British Columbia Department of Education. The examination papers are forwarded from Victoria and are returned there for grading. In outlying districts correspondence courses are provided at a nominal fee by the British Columbia Department of Education.

Educational matters in Yukon are in charge of a Superintendent of Schools, resident at Dawson, who is responsible to the Commissioner. Annual inspections of all schools are made by the Superintendent.

Section 3.—Statistics of Schools, Universities and Colleges

This Section summarizes the statistics of all educational institutions in Canada classified into four types: provincially controlled schools, privately controlled schools, universities and colleges and federal Indian schools.

1.—Enrolment in Educational Institutions, classified by Types of School and by Provinces, School Year 1949-50

¹ Estimated. ² Schools for the blind and deaf; these are boarding schools and many of the pupils are from provinces other than the one in which the school is situated. ³ Courses for elementary teachers only; those for secondary teachers are included in university enrolment.

The provincially controlled schools are the most important group and account for about 90 p.c. of the total enrolment shown in Table 1. These systems of public elementary and secondary education are financed mainly by local school authorities, assisted by provincial grants. There are private schools in all provinces (i.e., schools that are not conducted by publicly elected or publicly appointed boards and are not financed out of public money) but their enrolment is not large in comparison with that of the public schools. At the level of higher education, there is a provincial university in each of six provinces and one or more colleges supported out of provincial funds in the other provinces. In addition, there are 16 private universities most of which receive provincial aid and 163 colleges giving degree credit courses. For information on the inauguration of a system of federal grants to universities and colleges, see p. 337. Agricultural schools and colleges are listed in the 1943-44 Year Book, pp. 203-213.

Subsection 1.—Provincially Controlled Elementary and Secondary Schools*

Enrolment and Attendance.—At the elementary-school level, enrolments have been increasing since the school year 1944-45, except in Saskatchewan. Birth registrations of the past few years indicate that by 1953-54 the enrolment in Grades I to VIII will have increased from 1,712,662 to over 2,307,000, a total of 595,000, and there is every indication that the increase may amount to 800,000 by 1960. A decline may set in shortly after that. An increase of 800,000 is equal to over 45 p.c.

* Day and technical schools only.

of the 1944-45 enrolment in the elementary schools of Canada. Grades above Grade VIII will begin to feel the effects between 1953 and 1955 and by 1965 secondary school enrolment may be close to double the present total.

Other factors operating to increase enrolment include: the introduction of family allowances in 1945 which, while showing its effects on schools most clearly in improved attendance, is also keeping in school to the legal age limit many pupils who might otherwise leave from a few months to two years before they are lawfully entitled to leave; increased emphasis on the holding power of schools; increased transportation facilities at public expense; the building of dormitories in some provinces; the larger unit of administration; the establishment of junior high schools and composite schools; and the wave of post-war immigration. Enrolment in provincially controlled schools is given for the latest school year available in Table 1 and average daily attendance is shown in Table 2. The average daily attendance figures are more comparable, as between provinces, and for most purposes probably more significant than those of enrolment.

2.—Average Daily Attendance in Provincially Controlled Schools, by Provinces, School Years Ended 1941-50

NOTE.—Comparable figures for earlier years will be found in previous editions of the Year Book, beginning with the 1932 edition.

¹ Including 407 Grade XI students and 72 Grade XII students enrolled in Prince of Wales College.

Teaching Staffs.—In 1950 the teaching staffs of the publicly controlled elementary and secondary schools comprised 22,761 men and 62,531 women, a total of 85,292. Omitting Quebec for which comparable data are not available, 35 p.c. of the teachers were in cities, 27 p.c. were in towns and villages, 25 p.c. were in one-room rural schools, and the remaining 13 p.c. in schools of two or more rooms outside of urban centres. The proportion of men teachers is increasing and in 1950 reached 29 p.c., a little short of the pre-war level of 30 p.c. Again omitting Quebec where 36 p.c. of the teachers are members of religious orders, approximately 25 p.c. of the women teachers are married. Of the total number of teachers in the nine provinces, at least 10 p.c. are only partially trained or are untrained; also about 10 p.c. of the total staff leave the profession each year. During the 1949-50 school year there was an increase of \$110 in the median salary (see Table 4) for teachers in the nine provinces (Quebec excluded).*

4.—Teachers in Provincially Controlled Schools classified according to Salary, by Provinces, School Year 1949-50

Financial Support.—The income required to support the public elementary and secondary schools is derived almost wholly from local taxation and provincial grants. Fees for elementary schooling may be charged in Quebec. In some of the other provinces fees are charged for secondary grades but, except where in lieu of taxation, they are quite nominal.

In general, school boards submit their budgets to the local municipal councils which levy for and collect the required amounts. School boards in Quebec and some boards in other provinces have the power to levy and collect taxes for school purposes. Assessment on which taxes for school purposes are levied is the valuation of land and buildings (or improvements in some cases) and usually some other factor such as personal property or business income.

Each province has its own method of apportioning grants to local school boards. These grants are of two types. (1) The basic grant may be calculated on a basic minimum cost, an amount per classroom, salary and qualifications of teacher, average attendance, etc. All provinces adopt some means of increasing equality of opportunity by favouring poorer areas over richer ones. (2) Special grants are paid for such features as transportation, music, arts and crafts, special classes, equipment, building costs, night classes, etc. Special grants loom largest in Quebec where there is marked emphasis on training for home industries, arts and crafts.

* More detail is given in D.B.S. report *Teachers' Salaries and Qualifications in Nine Provinces, 1950*.

Newfoundland schools are financed largely from provincial funds. Tuition fees may be charged for Grades I to VIII only, except in the 'colleges' (St. John's) where fees may be charged for Grades I to XI. Fees may be charged also to provide for fuel and cleaning or these may be provided in kind. There is no local taxation for school purposes. Provincial grants are mainly for teachers' salaries, school plant maintenance and repairs, and the erection of buildings.

Table 5 presents a comparable statement of the finances of school boards operating publicly controlled schools so far as this can be done with existing records.

5.—Financial Support of Provincially Controlled Schools, by Provinces, for Provincial Fiscal Years Ended 1939, 1948 and 1949

NOTE.—The receipts shown in this table do not include any amounts raised by loans or the sale of bonds or debentures, as all revenue of this nature must be repaid ultimately with money raised by local taxation. Figures from 1914 are given in the corresponding tables of previous Year Books beginning with the 1936 edition. The fiscal years of all provinces end Mar. 31, except Nova Scotia (Nov. 30) and New Brunswick (Oct. 31).

¹ Net figures, after deduction of sinking funds, except for British Columbia 1939, for which the gross figure is given. ² Estimated. ³ Includes contributions to teachers' salaries and, in New Brunswick, grants made to schools by the Vocational Education Board. ⁴ Latest available figures. ⁵ Includes amounts raised by counties and the township grants on salaries of rural public school teachers. ⁶ In addition, there are local boards within larger units. ⁷ In 1946 the local school districts were amalgamated into larger administrative units.

Subsection 2.—Private Elementary and Secondary Schools

Private schools include all those not operated by publicly elected or appointed boards. Except in Quebec, they receive no support from public funds. Instruction is similar to that given in public schools except that more opportunities may be given for music, art, etc., and in schools under religious control there is greater emphasis on religious instruction. In most provinces there is some form of inspection or regulation by the provincial department of education.

Of the 828 private schools reported in 1950, 505 were in Quebec, 122 in Ontario, 120 in the Prairie Provinces, 43 in British Columbia and 38 in the Maritimes. There were 6,455 full-time teachers of whom 1,334 were men. Outside of Quebec, the salaries for lay teachers ranged from \$600 to \$4,800 with a median of \$1,325 for women, and from \$800 to \$8,000 with a median of \$2,037 for men.

In these schools, 63 p.c. of the pupils, including 41,000 girls and 24,000 boys, were in the elementary grades. At the secondary level there were 22,000 girls and 11,000 boys.

The private schools are financed largely from fees, legacies, gifts, or by religious orders. The fees range from very little to upwards of \$1,000 per year. In 1948 they averaged \$100 for day students and \$500 for boarders. Excluding Quebec, the expenditures of the private schools in 1949 amounted to over \$7,850,000. Of this amount \$2,303,000 was paid out in teachers' salaries.

6.—Enrolment in Private Elementary and Secondary Schools, by Provinces, Specified School Years Ended 1921-50

NOTE.—Figures for intervening years will be found in the corresponding tables of the 1937, 1942 and 1946 Year Books.

¹ Exclusive of Quebec.

² Exclusive of Newfoundland.

Business Colleges.—Of the 152 business schools reported in 1950 in eight provinces (exclusive of Quebec and Newfoundland) 18 were in the Maritimes, 85 in Ontario, 27 in the Prairie Provinces and 22 in British Columbia. There were 221 men and 459 women employed as full-time teachers and 72 men and 159 women as part-time teachers.

Girls predominate in the student body and the enrolment in evening classes is almost equal to the full-time day enrolment. The 1950 enrolment was: full-time day classes, 4,424 boys and 12,894 girls; part-time classes, 521 boys and 2,043 girls; evening classes, 4,156 boys and 11,764 girls. The total for the year was about 2,000 less than in 1946 and 1947. About 55 p.c. of the students were 17 to 19 years of age.

Monthly fees ranged from \$5 to \$25 for day classes and from \$3 to \$15 for evening classes. Total operating expenditures for these schools amounted to over \$1,500,000 in 1949 of which \$830,000 was for teachers' salaries.

7.—Enrolment in Private Business and Commercial Schools (Business Colleges), by Provinces, Specified School Years Ended 1921-50

NOTE.—Figures include day and evening classes. Those for intervening years will be found in the corresponding tables of the 1937, 1942 and 1946 Year Books.

Year	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.	Total

² There are no schools of this type in Newfoundland.

Subsection 3.—Indian Schools*

A great expansion has taken place in the educational work being carried on by the Federal Government for the benefit of Indian children and adults. In the year ended Mar. 31, 1951, 435 Indian schools were in operation, including 67 residential, 3 combined and 365 day schools. The enrolment in residential schools was 9,357 and in the day schools 15,514, the latter showing an increase of 5,196 pupils since 1947.

Enrolment in Indian schools, by provinces, for the year 1950-51 was as follows: Prince Edward Island, 51; Nova Scotia, 591; New Brunswick, 416; Quebec, 2,208; Ontario, 5,736; Manitoba, 3,205; Saskatchewan, 3,423; Alberta, 3,141; British Columbia, 5,094; Yukon Territory, 317; and the Northwest Territories, 689.

* Prepared in the Indian Affairs Branch, Department of Citizenship and Immigration, Ottawa.

8.—Enrolment and Average Attendance at Indian Schools, Years Ended Mar. 31, 1942-51

Year	Residential Schools		Day Schools		All Schools		
	Enrolment	Average Attendance	Enrolment	Average Attendance	Enrolment	Attendance	
						No.	P.C. of Enrolment
1942.....	8,840	8,283	8,441	5,837	17,281	14,120	81.7
1943.....	8,830	8,046	8,046	5,395	16,876	13,441	79.6
1944.....	8,729	7,902	7,858	5,355	16,587	13,257	79.9

1949.....	9,368	8,345	12,615	10,414	21,983	18,759	85.3
1950.....	9,316	8,593	14,093	12,060	23,409	20,653	88.2
1951.....	9,357	8,779	15,514	13,526	24,871	22,305	89.7

In addition to pupils in Indian schools, there were 1,468 Indian children enrolled in elementary grades in provincial schools and 564 in secondary provincial schools. Thus the total enrolment of Indians in educational classes numbered 26,903 in 1950-51.

An active building program has been conducted in recent years and many new day schools have been erected. Assistance is given to pupils attending high schools, technical schools and universities through the payment of individual tuition grants. In 1950-51 there were 1,051 Indians receiving secondary education.

The administration of Indian affairs generally by the Indian Affairs Branch of the Department of Citizenship and Immigration is dealt with in Chapter III, pp. 156-160.

Subsection 4.—Universities and Colleges

The most significant event in the development of higher education in Canada during the academic year 1951-52 was the inauguration of a system of federal grants to be paid directly to the universities and colleges to help sustain their essential functions and to assist in their further development. Prior to 1951-52, federal assistance to the universities was restricted to fields of study and research considered as national in scope. This assistance usually took the form of national scholarships to students or subsidies to universities for research projects related to the promotion and utilization of national resources, related to national defence, or to national health and welfare.

The change in federal policy was the result of the inquiry of the Royal Commission on National Development in the Arts, Letters and Sciences in Canada. The Commission reported that the universities, although provincial institutions, make great and indispensable contributions to the development of the arts, humanities and sciences, and to scholarship and research throughout the country, but that the financial position of most of the universities was such that they were unable further to develop their functions and were in danger of being forced to curtail and restrict their progress. The Royal Commission, therefore, recommended that federal grants be made to support the work of universities with full cognizance that such grants would not trespass on or limit provincial responsibilities in matters of education.

For the academic year 1951-52, the project was in a preliminary or experimental stage. The prescriptions and regulations governing the university grants for the initial year were authorized by Order in Council (P.C.123, Jan. 9, 1952). The amount, \$7,100,000, voted for this purpose under the present proposal was allocated on a population basis at a rate not exceeding 50 cents per capita for each province. The population figures used were those of June 1, 1951, estimated in August 1951 by the Dominion Bureau of Statistics, and the proportion of the grant for each university and college within a province must not exceed that which the university-grade enrolment of the individual institution bears to the total provincial university-grade enrolment.

To overcome anomalies in the level of education considered as of university grade, the enrolment has been restricted to students in full-time attendance at a university or college registered in a program of studies leading to a recognized university degree, or to a diploma for which a university degree is prerequisite.

Institutions considered eligible for the federal grants are those that have attained membership within the National Conference of Canadian Universities and the affiliated colleges of those universities. The college must provide at least two years of instruction, each year of which gives full credit towards a university degree.

The new grants are timely in that they are initiated in the year which will see the expiration of federal allowances to universities for the education of war veterans, and an expected drop in enrolment from that of recent years.

Graduate Schools.—Prior to 1940, five of the English language universities—Toronto, McGill, Queen's, Manitoba and Alberta—carried graduate work to the doctorate level in certain fields of study. The University of Montreal and Laval University in the French tradition had a wider variety of 'doctorats' in the graduate faculties and professional schools that comprised the university organization. All the major universities provided courses of study to the mastership level, but in all cases the fields of graduate study were restricted.

In 1940 Laval University organized a school of graduate studies in which the direction of all graduate work was centralized.

During the past five years Dalhousie University, the University of New Brunswick, the University of Ottawa, the University of Western Ontario and the four western provincial universities have established schools, or separate faculties, of graduate studies and research. McGill University has increased its roster of doctoral degrees and the University of Toronto has assumed the status of a fully rounded school of graduate studies with degrees to the doctorate level in all disciplines.

Enrolment.—Undergraduate students registered in the full-time session for 1949-50 numbered 69,011, a drop of 9 p.c. from 75,807 undergraduates of the preceding year and 13 p.c. lower than the peak year 1947-48 registration of 79,225 undergraduate students. The Department of Veterans Affairs records show that student veterans in 1949-50 represented 18.9 p.c. of the total undergraduate student body; in 1948-49 the proportion was 28.8 p.c. and in 1947-48 it was 37.3 p.c. The Department estimates that less than 2,000 veteran students will be included in the 1951-52 enrolment.

In graduate schools and courses enrolment has increased. The universities reported 5,122 post-graduate students in the full-time session for 1949-50 as compared with 4,857 in 1948-49 and 4,139 in 1947-48. War-veteran students represented 20.7 p.c. of the 1949-50 post-graduate students, 26.8 p.c. of the 1948-49 registration and 21.7 p.c. in 1947-48.

The total full-time enrolment of university-grade students includes some who entered university under the Department of Veterans Affairs training scheme but whose war-service benefits have expired. These students account for a certain degree of inflation in the enrolment. However, after allowance is made for them and for civilian students whose entrance to university was delayed by lack of accommodation during the period of inflated enrolment, enrolment for 1951-52 should be higher than that of the pre-war years.

Interprovincial Student Migration.—The student body of Canadian universities, recorded by province, includes students from foreign countries and students whose place of residence in Canada is outside the province in which they are attending university. There is considerable variation in the proportions of students who attend university in their home province. Several factors promote the interprovincial migration of students.

The Provinces of Nova Scotia and New Brunswick record 32 p.c. and 30 p.c., respectively, of their students from other provinces of Canada, mainly from sister Maritime Provinces. For the sake of economy, there is considerable centralization of professional training at Halifax for students of the Maritimes. The University of New Brunswick conducts the only English-language School of Forestry east of Toronto, Ont. Further, there is the factor of denominational church-controlled universities in the region, the largest Baptist and United Church universities east of Toronto are located in New Brunswick, while the largest Anglican university east of Toronto is in Nova Scotia.

Quebec and Ontario have the largest graduate schools in Canada and the largest French-language universities. These factors have a bearing on their student enrolment from other provinces.

The total enrolment of university-grade students for 1949-50 may be expressed in the following proportions:

Province	Full-time Enrolment (Undergraduate and Post-Graduate)	Percentages from—		
		Home Province	Other Provinces of Canada	Foreign Countries
	No.			
Newfoundland.....	324	100	—	—
Prince Edward Island.....	298	88	11	1

British Columbia.....	7,957	89	9	2
ALL PROVINCES.....	74,133	84	11	5
	=====	==	==	==

University Graduates.—In 1949-50 there were 17,681 bachelor and first professional degrees awarded, about 18 p.c. going to women. Awards in the arts and sciences, including commerce, represented approximately one-half of the total basic degrees conferred. Graduates in applied science, engineering and architecture represented 11 p.c. of the total and the medical sciences, including dentistry, pharmacy and nursing degrees, made up about 10 p.c.

At post-graduate level there were 1,186 master's degrees, 513 licentiates and 26 doctorates in course. About 23 p.c. of all those receiving post-graduate degrees were women.

9.—Graduates from Universities and Colleges, School Years Ended 1939 and 1948-50

NOTE.—Figures for 1920-36 are given at pp. 993-997 of the 1938 Year Book and for 1937-47 in the corresponding tables of subsequent editions.

¹ Includes Bachelors of Letters and of Social Science.

² Includes Bachelors of Accountancy and Secretarial Science.

³ Includes diplomas in Architecture from the Schools of Fine Arts of Montreal and Quebec.

⁴ Excludes teacher diplomas.

⁵ Includes M. Com. and M. Ed. or M. Paed.

⁶ Includes M.A.Sc., M.S.A., M.Sc.F., M.Arch., M.V.Sc., M.Sc. Dent., M. Surgery (where conferred separately).

⁷ Except diplomas for teachers and theologians.

Staffs.—On the basis of full-time university-grade enrolment in the regular session, there was one teacher for eight students in 1950, one for nine students in 1948 and 1949, and one for six students in 1941. This computation includes the part-time and full-time teaching staff recorded for each year. The ratio of full-time staff to full-time enrolment is almost double that of the above but this ratio excludes a large number of instructors in professional schools, such as medicine, where a considerable part of the teaching is done by part-time personnel.

The teaching complement for certain years since 1921 was as follows:—

School Year Ended—	Faculties of Arts and Science		Professional Schools		Totals (excluding duplicates)	
	Full-time	Part-time	Full-time	Part-time	Full-time	Part-time
1921.....	1,191	242	942	1,179	2,133	1,352
1931.....	1,776	519	1,127	1,705	2,903	2,077
1941.....	2,037	579	1,707	2,420	3,452	2,185
1946.....	2,466	1,010	2,645	2,440	4,937	2,797
1947.....	2,814	1,002	3,078	2,478	5,246	3,441
1948.....	3,042	1,119	3,257	2,667	5,447	3,591
1949.....	2,871	1,202	3,051	2,755	5,339	3,877
1950.....	2,890	1,153	3,078	3,036	5,246	4,127

Salaries paid to the full-time teaching staff are somewhat higher than in pre-war years. There is a considerable disparity between salaries paid to teachers in science, engineering and medicine and those paid to teachers in the humanities. The Report of the Royal Commission on National Development in the Arts, Letters and Sciences included the following data on annual salaries paid in three representative universities in 1949-50 to these two groups of teachers:—*

Classification	Humanities Division			Engineering, Science and Medicine		
	Professors			Professors		
	Full	Associate	Assistant	Full	Associate	Assistant
	\$	\$	\$	\$	\$	\$
High.....	6,500	5,500	3,750	Over 10,000	7,000	6,500
Upper quintile.....	5,750	4,250	3,500	6,500	4,500	3,500
Median.....	5,000	3,750	3,000	5,500	4,000	3,250
Mode.....	5,000	3,500	3,000	5,000	4,000	3,000
Low.....	3,750	3,000	2,500	4,000	3,250	2,250

Income and Expenditures.—A record of the sources of annual income for a representative group of universities and colleges is given in Table 10 for certain years from 1921 to 1950. For the academic year 1949-50, the institutions in the sample, representing about 85 p.c. of the total enrolment, reported an expenditure of \$651 per student. In Nova Scotia and New Brunswick the rate was \$488 per student; in Quebec \$794; in Ontario \$657; and in the western provinces it was \$589 per student. Student fees represented 38 p.c. of the total income reported and provincial grants constituted 36 p.c.; special allowances made to the universities by the Department of Veterans Affairs amounted to 6 p.c. of total income and that available for general purpose from endowments constituted an additional 7 p.c. The balance, about 13 p.c., was made up of gifts, small contributions from a few municipalities and all other sources of income including the grants from churches to some denominational institutions.

* Report of the Royal Commission on National Development in the Arts, Letters and Sciences in Canada, Ottawa, Queen's Printer, 1951, Tables I and II, pp. 139-140.

10.—Income and Capital Resources of Universities and Colleges, Specified School Years Ended 1921-50

NOTE.—The larger universities and many of the colleges in Canada are included and represent an enrolment of approximately 80 p.c. of the full-time students of university grade throughout the period. The institutions omitted are mainly those conducted by religious orders where teachers receive little or no salary and the financial returns are consequently not comparable.

University Training under the Veterans' Rehabilitation Act.*—Assistance to veterans in training is provided under the Veterans' Rehabilitation Act as outlined in the 1948-49 Year Book at pp. 321-322.

Since veterans were obliged to commence their university training within 15 months after discharge, the number entering training has dropped very sharply. In the academic year 1950-51, approximately 8,000 veterans in universities were receiving assistance through the Department of Veterans Affairs compared with about 15,000 in 1949-50 and 24,000 in 1948-49. Since the commencement of the training program 9,000 veterans have had insufficient qualifying service to carry them through to graduation but 6,068 of them qualified for continued assistance by securing scholarship standing in their universities. In 1949-50, 94 p.c. of the student veterans passed their examinations and won a high proportion of the available scholarships.

The distribution of the 8,000 veterans enrolled in 1950-51 by academic years, was: first year 255; second year 309; third year 1,140; fourth or subsequent year 4,605, and post-graduate 1,299. Since the inception of the rehabilitation program in 1941, 54,000 veterans have received university training.

PART II.—CULTURAL ACTIVITIES RELATED TO EDUCATION

REPORT OF THE ROYAL COMMISSION ON NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES†

The basis of the appointment of the Royal Commission on National Development in the Arts, Letters and Sciences in April 1949 and its objectives are presented in the Year Book 1951 at pp. 315-316. The Commission completed its work and tabled its Report in Parliament on June 1, 1951. The Report immediately aroused great interest in the press and with the public, and in the following months it was the subject of innumerable articles and commentaries.

* Prepared in the Department of Veterans Affairs, Ottawa.

† Ottawa, Queen's Printer, 1951.

As a preface to the Report the Commission quoted a passage from St. Augustine defining a nation: "A nation is an association of reasonable beings united in a peaceful sharing of the things they cherish; therefore, to determine the quality of a nation, you must consider what those things are". From this felicitous quotation and from evidence given in the Report it seems apparent that the Commissioners proceeded throughout their task on the assumption that in the arts and letters may be found a useful yardstick of a nation's culture and, further, that the arts and letters of any country can be important unifying factors. This theme occurs frequently throughout the Report; for example, in discussing the theatre and music in Canada their unifying influence on the country as a whole is emphasized. It seems evident, too, that in surveys of the various federal institutions and agencies which were reviewed particular attention was given to the manner in which these institutions might best serve the country as a whole.

Implicit throughout the Report seems to be the conviction that Canadian institutions which serve the national interests are logically entitled to some measure of support from the Federal Government. For example, recommendations were made concerning grants to Canadian universities and for the establishment of a council the principal duty of which would be to strengthen voluntary organizations concerned with matters reviewed by the Commission.

The Report of the Royal Commission is presented in two parts; the first consists of a survey of the many and varied subjects which the Commission was instructed to consider, and the second deals with the 146 recommendations presented under eight principal headings. It is proposed here to summarize the recommendations concerning national museums, federal libraries, public records and archives, historic sites and monuments, aid to universities, national scholarships and the establishment of a council for the arts, letters, humanities and social sciences. For accounts of the recommendations of the Royal Commission concerning the National Gallery, the National Film Board, and the Canadian Broadcasting Corporation, see pp. 347, 348 and 352, respectively.

The survey of the national and local museums found that Canadian museums lag far behind those of comparable countries. The Commission recommended that the present National Museum of Canada be given more space and more funds and that its principal exhibits be confined to Canada's geology, botany and zoology, and to the natural resources on which the primary industries of the country are founded. Further, the creation of a new Canadian Historical Museum was recommended for the exhibition of various historical collections now in the custody of the Public Archives, the Canadian War Museum and certain departments and agencies of the Federal Government. The Report also recommended the creation of a Canadian Museum of Science as well as national botanical and zoological gardens in appropriate regions of Canada.

The overcrowded condition of the Library of Parliament was examined and it was recommended that most of the collection be removed for safe-keeping, leaving space for adequate working library services and suitable stacks. The Commission further recommended the immediate establishment of a National Library.

Concern was shown regarding the extent to which the files of most government departments are congested with inactive or worthless documents and records and the Commission noted the very considerable storage spaces which the Department of Public Works must provide for great quantities of outdated records. The Commission therefore recommended that the responsibility of the existing Public Records

Committee be clearly defined and that a systematic and continuous transfer of inactive records from all departments and agencies of government be made to the Archives. A number of recommendations were designed to correct the existing situation, to prevent its recurrence and to ensure that valuable historical documents receive proper care and that worthless records be systematically destroyed.

The Report dealt at some length with the work of the Historic Sites and Monuments Board which was commended for its accomplishments on a modest budget. The Commissioners observed that much has yet to be done to preserve what remains of historic buildings and to mark the sites of important events in Canadian history. It recommended that it be made possible for the Historic Sites and Monuments Board to undertake a much more comprehensive program and that the Board be reconstituted and provided with permanent secretarial assistance. Immediate measures were urged for the restoration of the Halifax Citadel, one of Canada's great military monuments which is fast falling into complete ruin.

A variety of problems with which Canadian universities are now faced were reviewed at length and particular concern was felt for the low estate to which the study of the humanities has fallen. The financial plight of the universities was considered in detail and a strong argument advanced in support of federal aid to education (*see p. 337*).

Closely linked with the consideration of aid to universities were proposals for the creation of a system of national scholarships. The Commission recommended that existing grants to the National Research Council for scholarships be maintained, that a system of post-graduate scholarships be introduced for students engaged in the study of the humanities, the social sciences and law, and that funds be made available to provide exchange scholarships for scholars and students from other countries. It urged a comprehensive system of scholarships at the undergraduate level, proposing 100 annual scholarships of \$1,000, 250 scholarships of \$500, 2,000 bursaries of \$500 a year and the establishment of a loan fund open to students whose work is acceptable to their university authorities. In addition, the Commission proposed further scholarships and grants for persons engaged in the arts and letters but not enrolled in university. These scholarships would be given to artists, musicians, men of letters and students or practitioners of broadcasting, films and the press.

In the final chapter of the Report, the Commission recommended in considerable detail the establishment of a new semi-independent body to be known as the Canada Council for the Encouragement of the Arts, Letters, Humanities and Social Sciences. Outlines were given of the structure of this organization, partly administrative, partly advisory in nature, which would be financed by federal funds but would have a large measure of independence in its operations. In brief, this Council would have functions similar to those of both the Arts Council of Great Britain and the British Council. In addition, the proposed Council (its short title to be the Canada Council) would assume the duties of a national commission for UNESCO and would work to the greatest extent possible through existing voluntary organizations which it would be the Council's principal duty to strengthen financially and otherwise. The Canada Council would be composed of fifteen appointed members, representative of the various cultures and regions of Canada. The Commission recommended that the Canada Council establish a central office of information on those aspects of the arts, letters, humanities and social sciences that fall within its competence. The duty of the Council, moreover, would be to encourage Canadian

music, drama and ballet by such means as the underwriting of tours within Canada, and the establishment of awards to young Canadians of promise and also to strive to increase the knowledge of Canada abroad by arranging tours by Canadian lecturers and by performers in music and the allied arts. The Commission proposed that the Council arrange abroad exhibitions of Canadian art in its varied forms. The Canada Council would administer the system of post-graduate scholarships to be created in the arts, letters, humanities and the social sciences.

At the end of the Report, the Commissioners observed that, "We are under no illusion that the results which we trust may be achieved from the creation of the Canada Council can be attained cheaply; indeed, we observed in the introduction to this part of our Report that if we in Canada want a more generous and better cultural fare we must pay for it. It is obvious that the system of scholarships and awards mentioned above and the furtherance of the work of UNESCO in Canada would cost considerable sums of money". However, "if all our recommendations were accepted, the total figure might in isolation appear substantial; but in comparison with the costs of other activities of Government, it would be modest, almost insignificant".

Although the Canadian press and public have been far from unanimous in their attitude towards the recommendations, there has been a widespread conviction that the Report is a work of real distinction and a very great landmark in the development of Canada as a united and cultivated community.

Section 1.—The Relationship of Art to Education*

Fine Art Schools, Galleries and Museums.—Fine art appears as an elective subject in the curricula of the faculties of arts in a number of universities, where it may be taken as one subject among five for a year or two; in some, e.g., Acadia University, N.S., there are six or more elective courses. In Mount Allison University, N.B., and in the University of Saskatchewan, there is a sufficient number of courses to allow the taking of a Bachelor degree with specialization in fine art. At the University of Toronto, Ont., an Honour B.A. in art and archæology is offered as well as graduate work in this field. Departments of fine arts have been opened by McGill University (1948-49), and the University of British Columbia (1949-50) and re-opened by McMaster University (1951).

There are also schools of art not requiring any fixed academic standing for admission, which are concerned more with the technical development of the artist. The most widely known of these are:—

Nova Scotia College of Art, Halifax, N.S.

École des Beaux-Arts, Quebec, Que.

École des Beaux-Arts, Montreal, Que.

School of Art and Design, Montreal Museum of Fine Arts, Montreal, Que.

Ontario College of Art, Toronto, Ont.

University of Manitoba School of Art, Winnipeg, Man.

Provincial Institute of Technology and Art, affiliated with the University of Alberta, Calgary, Alta. (Summer session at Banff, Alta.)

Vancouver School of Art, Vancouver, B.C.

Courses in these schools vary in length with the requirements of the individual student, but may extend over as many as four years. Summer schools of art are sponsored by some of the foregoing institutions, by universities, and by various independent groups.

* Revised under the direction of Dr. H. O. McCurry, Director, National Gallery of Canada, Ottawa.

Public art galleries and museums in the principal cities perform valuable educational services among adults and children. Children's Saturday classes, conducted tours for school pupils and adults, radio talks, lectures and often concerts are features of the programs of the various galleries. In many cases these institutions supply their surrounding areas with travelling exhibitions, while the National Gallery of Canada carries on a nation-wide program of this nature.

The principal art galleries and museums* are:—

New Brunswick Museum, Saint John, N.B.
 Museum of the Province of Quebec, Quebec, Que.
 Montreal Museum of Fine Arts, Montreal, Que.
 National Gallery of Canada, Ottawa, Ont.
 National Museum of Canada, Ottawa, Ont.
 London Public Library and Art Museum, London, Ont.
 Art Gallery of Toronto, Toronto, Ont.
 Royal Ontario Museum, Toronto, Ont.
 Art Gallery of Hamilton, Hamilton, Ont.
 Willistead Library and Art Gallery, Windsor, Ont.
 Winnipeg Art Gallery, Winnipeg, Man.
 Edmonton Museum of Arts, Edmonton, Alta.
 Vancouver Art Gallery, Vancouver, B.C.

The National Gallery of Canada.—Founded in 1880 by the Marquis of Lorne, the National Gallery at first served only as an exhibition gallery. Provided with an Advisory Arts Council in 1907, and incorporated under a Board of Trustees in 1913, it has assembled its permanent collection largely during the past 40 years. This collection of pictures and sculpture, prints and drawings, representing the styles of past and present of various parts of the world was assembled for public enjoyment, study, and the improvement of arts and industrial products, and as the necessary basis for any program of art education.

The collection of the National Gallery to-day is of international repute and is accessible to the whole country by means of catalogues, photographs and colour reproductions and to a limited extent by loans. The Canadian section, naturally the most inclusive, is the best available source for the study of Canadian art. A number of the more important recent additions to the permanent collection have been in the field of French painting which for some time had been unavoidably neglected because of insufficient funds. *Chevaux de courses* by Degas and *Portrait de paysan* and *Forêt* by Cézanne are outstanding examples acquired from the Vollard collection. The presence of this famous collection in Canada accounts for one of the most interesting chapters in the Gallery's history. Formed by Ambroise Vollard (1867-1939), the French connoisseur, art dealer and publisher, it was taken to Portugal in 1940 and then consigned to the United States. The Royal Navy seized it at Bermuda on suspicion that it had come under Nazi control and was being sent to America under false pretences. It was then deposited in the National Gallery of Canada for safe-keeping. In 1948 it was released to the owners and in 1950 the sisters of Vollard allowed their part of the collection to be exhibited in Canada, an event which caused considerable interest throughout the country. Three other French paintings were presented by H.S. Southam, C.M.G., LL.D., of Ottawa: *L'Evasion* by Daumier and *Dans le bois: neige* and *Femme aux gants* by Courbet. Works by Van Gogh and Redon were purchased and acquisitions in other departments included works by Tiepolo and Augustus John. Canadian paintings include

* A complete list of Canadian art museums, societies and schools is included in the Canadian section of the current issue of the *American Art Annual* (Washington, American Federation of Arts).

a representative selection of contemporary work and additions to the collection of earlier painting. Drawings by Guardi, Claude, Sébastien Bourdon, Adriaen van Ostade, Constable, Renoir, Rouault and others have also been added. Prints included examples by Rembrandt, Goya (a complete set of the first edition of the *Tauromaquia*) and Rouault.

In 1951, exhibitions of the art of other countries included: *Scottish Painters*, *Contemporary Irish Painting*, *Lovis Corinth*, *Pageant of Britain*, *Swedish Children's Art*, *Sculpture by Mestrovic*, *Vollard Collection*, *Ukrainian Folk Arts*, and *Paintings by J. M. W. Turner*. Among the Canadian exhibitions held were the *Sarah Robertson Memorial Exhibition*, the designs submitted for *Massey Medals for Architecture and Industrial Design 1950 B.C.-A.D. 1950*. A large Canadian exhibition sent to the National Gallery of Art, Washington, D.C., was opened on Oct. 29, 1950, by the Canadian Ambassador to the United States and was later shown in San Francisco, San Diego, Santa Barbara, Seattle and Vancouver.

The National Gallery carries out a program of extension work throughout the country. The majority of the exhibitions mentioned above, as well as the annual offerings of the chartered art societies and a variety of smaller collections, are available to the entire country and are widely circulated. About 30 such exhibitions are toured and a total of some 150 separate showings are thus held annually under the auspices of the National Gallery of Canada. In addition, individual loans of material from the collection are made to a number of centres in all parts of the country each year. In this way actual works of art are constantly being brought to the attention of the public. Sets of reproductions are also sent on tour of localities which have not the facilities for handling original works of art.

The latest major development in the general educational work of the National Gallery was established in 1948—an Industrial Design Section set up as the result of public interest in bringing the design of Canadian goods up to the best international standards and in fostering distinctive Canadian designs. A number of exhibitions on Canadian industrial art have been held in various parts of the country.

Other methods of education in the arts apply more specifically to young people and are designed, in part, to supplement regular school work. The Gallery provides written lectures illustrated by lantern slides on all aspects of art history, reproductions of paintings with introductory texts for art appreciation, school broadcasts, classes for school children at the Gallery, exhibitions of children's art, conducted tours of the Gallery's collections and educational demonstrations, public lectures at Ottawa, and lecture tours throughout Canada.

The National Gallery also maintains an art film library. Silk screen prints by Canadian artists, already famous in many parts of the world as the result of their distribution during the War, are available to schools and the public generally. These and the facsimile colour reproductions published by the National Gallery are listed in the free leaflet, *Reproductions, Publications, and Educational Material*. The magazine *Canadian Art*, in the publication of which the National Gallery takes a leading part, has doubled its circulation since 1945.

Speaking highly of the Gallery's work over many years despite serious difficulties, the Report of the Royal Commission on National Development in the Arts, Letters and Sciences* made recommendations for the extension and improvement of its exhibition and education services; increases in funds, staff and facilities;

* Ottawa, Queen's Printer, 1951. See also *Royal Commission Studies, a Selection of Essays prepared for the Royal Commission*. Ottawa, Queen's Printer, 1951.

maintenance and increase where possible of present appropriations for acquisitions; and, as soon as possible, a new building containing adequate facilities for display, storage, circulation of exhibitions, repair and restoration of paintings.

Other Art Organizations.—The leading art organizations of national scope, exclusive of museums and art galleries, include the following:—

Association of Canadian Industrial Designers
 Canadian Arts Council*
 Canadian Group of Painters
 Canadian Guild of Potters
 Canadian Handicrafts Guild
 Canadian Museums Association†
 Canadian Society of Graphic Arts
 Canadian Society of Painter-Etchers and Engravers
 Canadian Society of Painters in Water Colour
 Canadian Society of Landscape Architects and Townplanners
 Community Planning Association of Canada
 Federation of Canadian Artists
 Royal Canadian Academy of Arts
 Royal Architectural Institute of Canada
 Sculptors Society of Canada

Section 2.—The Educational and Cultural Functions of the National Film Board‡

Generally, the function of the National Film Board as defined in the National Film Act, 1950, is to produce and distribute films “designed to interpret Canada to Canadians and other nations”. The Board, in addition, is required to represent the Government of Canada in its relations with persons engaged in commercial motion picture film activity for the Government or for any government department; to engage in film research and to make results available to the film industry; to advise the Governor in Council in connection with film activities; and to discharge other duties relating to film activity in accordance with directions by the Governor in Council.

Publication of the Royal Commission Report on National Development in the Arts, Letters and Sciences brought attention to the functions of the Board and “their proper interpretation in relation to Canadian national life and culture”.

The National Film Board reaches Canadians through distribution of 16 mm. films produced for Canadian audiences; and through commercial theatres by the production and distribution of theatrical films without which Canadian audiences would see very few Canadian productions. The Board is currently producing more than 30 theatrical films annually and almost 100 non-theatricals.

The number of theatrical bookings of National Film Board short productions in the last nine months of 1951 increased by about 70 p.c. over the same period of 1950. In addition to the *Canada Carries On* and *Eyewitness* series in English (*En avant Canada* and *Vigie* in French), the Board also supplies newsreel features on Canadian subjects for Canadian commercial distribution. The tour of Canada

* An account of the Canadian Arts Council and a list of its constituent bodies appears in the 1951 Year Book, p. 308.

† Formed in 1947 with the object of improving the services of museums as educational institutions by promoting co-operation among themselves, by exchange with other countries and by the training and securing of expert staffs.

‡ Prepared under the direction of W. Arthur Irwin, Government Film Commissioner, National Film Board. The non-educational services of the National Film Board are outlined in Chapter XXVIII. See also Chapter II, p. 85.

in 1951, by Her Royal Highness, the Princess Elizabeth and His Royal Highness the Duke of Edinburgh was recorded in the Board's first full-length production in colour, *Royal Journey*. In addition to widespread Canadian distribution, *Royal Journey* is being shown in the United States, the United Kingdom, Europe, South Africa, Australia, New Zealand and some parts of Asia.

The non-theatrical program is based on a nation-wide system of film circuits, film councils and libraries. The program is deeply rooted in community activities and the films are shown in about 3,450 clubs, schools, churches and community halls. It is estimated that more than 10,000,000 Canadians will attend National Film Board non-theatrical showings during 1952. Operation of film circuits is progressively being turned over to voluntary community groups. Touching on this phase of film distribution, the Royal Commission Report called it "a remarkable example of improvisation with limited resources". Film councils—voluntary groups promoting wider use of documentary films—now number 338, an increase of 30 over last year. Forty new libraries were established, bringing the total to 305. More than 4,000,000 school children are being reached annually at approximately 60,000 school showings.

There are still many rural areas that rely on the National Film Board for films and film services. Free programs for both children and adults in rural areas are released monthly. In addition, the field officers of the National Film Board are available to assist in the organization of self-operating circuits. The latter are taken over by the area-film councils which, like their counterparts, the community-film councils, purchase their own projection equipment, train projectionists, organize workshops on film selection and use, and arrange film festivals where informational films produced in Canada and abroad are shown to the public.

In addition to providing monthly programs and technical assistance from its field staff, the National Film Board deposits large blocks of films in provincial and community film libraries on a free-loan basis.

In co-operation with federal departments, film libraries have been established in the specialized fields of health, welfare, medicine and biology, physical fitness and industry. Additions to these libraries are circulated across the country in preview blocks before being deposited in a central library from which they can be borrowed. The Board also offers a wide variety of information services, including instructional material on the selection and use of the films and filmstrips, discussion guides, teachers' notes, and film and filmstrip catalogues. The Board has deposited well over 25,000 films in local libraries.

Many different types of organizations, both governmental and voluntary, co-operate with and assist the Board in the distribution of films. The University of Alberta Extension staff is an example of technical instruction provided by a non-governmental body. The University of British Columbia administers rural film circuits. In the Maritime Provinces, distribution of National Film Board films to adult audiences is directed by the Department of Education. In some provinces, federations of agriculture assist with rural film distribution.

Films are being used to help interpret their own country to persons in the more settled parts of Canada and to bring to Canadians in more remote areas a picture of how people in other parts of Canada live. In schools and settlements throughout Yukon Territory, the Northwest Territories, Ungava and Labrador, National Film Board programs are being shown regularly for the native and white populations. Federal and provincial authorities co-operate in this work.

The story of Canada is also being told abroad in films as part of the function of interpreting Canada to other nations. Non-commercial distribution of films and filmstrips abroad is now carried on through 56 posts of the Departments of External Affairs and Trade and Commerce through National Film Board offices at London, New York and Chicago, and through universities, schools and other educational agencies. Non-theatrical showings of Canadian films abroad are attended by approximately 10,000,000 persons a year in 42 countries. Moreover, prints of National Film Board films are sold abroad at the rate of over 3,000 a year. This theatrical distribution is already well established in the United Kingdom and the United States and is rapidly expanding in Continental Europe and Latin America. A recent interesting development has been the advance in the use of National Film Board newsreel films and productions on United States television networks. Bookings currently are running at 1,500 annually. The National Film Board also provides newsreel feature coverage about Canada for United Kingdom, United States, and South American distribution.

Section 3.—The Educational and Cultural Functions of the Canadian Broadcasting Corporation*

Many hours of educational or semi-educational programs are broadcast annually by the Canadian Broadcasting Corporation in the English and the French languages. Whether these programs are directed to children or adults, entertainment is combined with information whenever possible. Spoken word programs cover a very wide range of interests and are presented as readings, talks, discussions, documentary programs, dramatizations or in forms combined with music.

Pre-School Broadcasts.—While many story programs for pre-school-age children are broadcast purely as entertainment, a special series has been developed to give young children, especially in remote areas, many of the benefits of kindergarten training. This series, *Kindergarten of the Air*, is broadcast Monday to Friday for children from two and one-half to six years of age. Planned with the advice of kindergarten experts and representatives of the Canadian Home and School Federation, the Federation of Women's Institutes and the Junior League, it includes stories, songs, mental games, keeping-fit exercises, information about animal life and nature study, and encourages good habits of hygiene, eating and relaxation. The program is intended primarily for home listening but it has been found useful in many organized kindergarten groups and classes.

School Broadcasts.—In an average school year, more than 1,000 school programs, mostly in dramatized form, are broadcast to all parts of Canada. The CBC also provides upwards of 30 minutes daily broadcasting of specifically planned programs by departments of education to meet classroom requirements. These "supplementary aids" help teachers to stimulate student imagination and strengthen motives for study. The National School Broadcasts series are planned by the National Advisory Council on School Broadcasting to promote among students a stronger consciousness of Canada and its achievements. During the 1951-52 season, six of these series were planned for students from Grade III to senior high school. These were: *Voices of the Wild*, on Canadian wildlife; a series on conservation of natural resources; *They Made History*, dealing with highlights in Canada's history; *Life in Canada Today*, a series of documentaries; *Julius Caesar*, a

* Prepared by Donald Manson, General Manager, Canadian Broadcasting Corporation.

full-length performance of Shakespearean drama; and *Things We Are Proud Of*, comprising five programs contributed by broadcasting organizations in Great Britain, Australia, New Zealand, South Africa and Ceylon, relating outstanding features in the development of those countries.

The Department of Transport issued more than 8,000 free receiving licences to schools throughout Canada in 1951-52, indicating that at least one-third of all English-language schools were radio-equipped and using school broadcasts.

In the Province of Quebec, the CBC's French network broadcasts *Radio-College*, a series of weekly programs dealing especially with the fine arts, music, literature, theatrical arts, sciences, religion and philosophy. These broadcasts are not designed for classroom use, being of a more adult nature than those on the English-language networks, and scheduled, in the main, for other than school hours.

Particulars of school broadcasts are contained in the manual *Young Canada Listens*, and details of the French network series in the manual *Radio-College*. Both are published annually by the CBC.

Adult Education.—Programs of an adult-education nature take many forms. Issues of the day are discussed on such round-table programs as *Citizens' Forum*, now in its eighth year, and its French network counterpart, *Les Idées en marche*. Both are produced in co-operation with the Canadian Association for Adult Education, and organized listening groups which form part of the audience carry on their own discussions of the topic following the broadcast. This Association co-operates with the Canadian Federation of Agriculture in the presentation of *National Farm Radio Forum*, a broadcast concerned primarily with discussion of topics of interest to Canadian farmers. This program has developed into the largest listening-group project of its type in the world. *Cross Section*, a series dealing with economic and social issues—a look at industrial Canada through the eyes of business, labour and the consumer—is typical of the dramatized documentary form in which many programs of an adult-education nature are presented. Understanding of human relationships is fostered by such series as *In Search of Ourselves*, presenting stories and a commentary by a psychiatrist, psychologist, or sociologist of people with mild emotional disturbances; *In Search of Mental Health*, showing recent improvements in the treatment of mentally ill people in Canada; and *Life With the Robinsons*, a dramatized story of human relations in a typical, ordinary family. On the French network, *Radio-Parents* presents broadcasts designed to help parents solve their problems, and general questions sent in by parents on the subject of child care are answered by psychologists in the series *Le Courrier de Radio-Parents*.

More than 2,600 hours are devoted annually to informative talks on a very wide range of topics including international affairs, consumer information, politics, business and labour interests, community activities and social problems, literature and creative writing, science, nature and sports.

The CBC maintains an office and a resident correspondent at United Nations Headquarters, and an overseas bureau with headquarters at London, England. For programs such as *CBC News Roundup*, voice reports are brought in from many parts of the world.

Music and Drama.—Music and drama are two of the chief items in the CBC schedules. Music makes up about 50 p.c. of the network programs, while those in the 'drama and feature' category take up the largest percentage of time

among spoken-word programs. High-quality programs of both types are heard frequently at good listening hours. Apart from regular broadcasts by Canadian symphony orchestras, the Metropolitan Opera programs, and similar programs, much fine music is presented on the CBC Wednesday Night program—a full evening on the Trans-Canada network for more discriminating listeners. The many periods of “standard” classical music on this broadcast are accompanied by programs giving expression to Canadian composers and contemporary composers of other countries. Chamber music by various groups as well as choral music originating at many points in Canada, and recitals by Canadian artists and those of international reputation are important features of the music schedules. Productions by the CBC Opera Company (which in the 1951-52 season included *La Bohème*, *The Marriage of Figaro*, *Manon*, *Peter Grimes*, and two Canadian operas, *Deirdre* and *Basmatchkin*) and by the CBC Light Opera Company are heard throughout the season.

During an average year more than 1,000 plays are produced by the CBC for the networks, chief among them the annual *Stage* series broadcast Sunday nights to a national audience, and longer items for the CBC Wednesday Night program. In this category, plays have ranged from adaptations of the humorous stories of Stephen Leacock to two-hour performances of Shakespearean dramas and such plays of Lister Sinclair's *Socrates*, Bernard Shaw's *Candida*, Christopher Fry's verse drama *The Lady's Not For Burning*, and *Crime Passionel* by the contemporary French writer Jean-Paul Sartre. A recent innovation has been the production of “anthologies” made up of prose, poetry and music, and programs such as *Vienna: The Glorious Age* which presented in dramatic words and music a comprehensive picture of an era.

Lighter fare is broadcast from production points across Canada, and includes a very high percentage of work by Canadian writers, both English and French.

Television.—Preliminary plans for CBC television broadcasting, expected to get under way at Toronto and Montreal in the autumn of 1952, call for a limited amount of broadcasting per day in the initial stages, and a program pattern roughly paralleling that developed for radio, but on a much smaller scale. As in radio programming, the objective of combining entertainment with information will be followed where possible.

The Royal Commission on National Development in the Arts, Letters and Sciences, in its report in 1951 which, after an intensive review of broadcasting in Canada, endorsed in the main the CBC's programming pattern for radio, had this to say about television programs:—

“It has been suggested that television may eventually supersede radio; if this should happen, most of what we have said of radio programs will apply to television. Again, television may develop and come to concentrate on its more immediately popular capacities such as variety shows, and sports and news actualities, leaving more serious programs to radio and films. For such television programs it will be essential to ensure the maintenance of good taste and a suitable and adequate use of Canadian material and Canadian talent The element of control necessary and now exercised by governments and by producers in radio and in the cinema will be far more important and far more difficult to achieve in the persuasive and subtle medium of television. We think it important also that, as with radio, the Board of Governors of the CBC endeavour at once to import the best programs from abroad, while developing so far as possible Canadian talent in Canadian programs.”

Section 4.—Public Libraries

The biennial survey of libraries in Canada, 1948-50, reports increased activity in the field of library service. At the national level, first steps have been taken toward the establishment of a National Library for Canada.

In June 1948, Parliament approved the principle of establishing a Bibliographic Centre at Ottawa and the preparation of a National Union Catalogue which would provide a nucleus for the reference department and the catalogues for a National Library. A National Library Advisory Committee was established with representatives from each province under the chairmanship of the Public Archivist. After some months of preparatory work, the Centre came formally into existence with the appointment of a Director and an initial staff on May 1, 1950.

The Bibliographic Centre has proceeded with the preparation of the National Union Catalogue. The catalogues of 21 libraries, covering more than 1,250,000 volumes, have been reproduced by means of microfilm. These reproductions will be co-ordinated to provide an index of the holdings of the main libraries in Canada, including information on the location of rare books that may be obtained on the basis of inter-library loans. Eventually the National Library will offer procurement services but, in the meantime, the catalogue represents a record of the book resources of Canadian libraries and provides a means for more effective use of those books.

A second project of the Bibliographic Centre is the monthly publication of *Canadiana*, a bilingual list of commercial and government publications relating to Canada. At present the Centre has a small stock of reference books that will be supplemented by volumes not in steady demand and located in various libraries across the country, and by standard publications of the United States. The index will be expanded to include holdings relating to Canada in the libraries of Great Britain, the United States and France.

Local Public Libraries.—As local institutions of education and culture, public libraries are mainly the responsibility of the municipalities in which they are located. In certain provinces, the provincial library authorities supplement the efforts of the municipalities by annual grants, by assistance to building-construction funds and by aid in the procurement of book stock. The public libraries in the cities represent the largest proportion of all such service in Canada. The libraries of seven cities, each with a population of over 100,000, held 36 p.c. of the entire book stock reported in the survey of libraries, and were responsible for 51 p.c. of all the expenditures recorded. The libraries in a second group of 29 cities, with populations of from 25,000 to 100,000, held 17 p.c. of the book stock and accounted for 22 p.c. of the expenditures. In the smaller cities with populations of from 10,000 to 24,999, 26 libraries held 9 p.c. of the book stock and were responsible for 9 p.c. of the expenditures. In all, the city libraries held 62 p.c. of the books and accounted for 82 p.c. of all expenditures on public library service.

It is estimated that some form of public library service is available to about 75 p.c. of the population but that barely 50 p.c. of the population has anything approaching adequate library service. In the small towns, villages and rural communities many public libraries are supported and administered by organizations or associations within the communities. Including these, less than 12 p.c. of the rural population has public library service and, where it does exist, it is in most cases quite inadequate.

Tables 1 to 4 summarize data on the holdings, service, income and expenditures of the public libraries of Canada for 1949. More details are available in the D.B.S. publication *Survey of Libraries 1948-50*.

¹ Territorial grant.

Regional Libraries.—In order to improve the library services in rural districts and in the smaller communities, all provinces except New Brunswick and Quebec have made some effort to establish regional libraries or modifications of such libraries. Prior to World War II, regional library service, or an adaption thereof, existed in British Columbia, Prince Edward Island, Newfoundland and Ontario. Since 1946, Saskatchewan has put into operation the North-Central Saskatchewan Regional Library with headquarters at Prince Albert, and is organizing a second section of this library. Nova Scotia has four new regional libraries in operation, the Annapolis Valley Regional Library, the Colchester-East Hants Regional Library, the Pictou County Regional Library and the Cape Breton Regional Library. Manitoba and Alberta have passed legislation providing for the organization of such libraries.

In the provinces where regional libraries are functioning, efforts have been made to improve the services rendered by increasing the number of distribution agencies and constructing new local libraries to act as regional depots.

Complete statistics for the new libraries were not yet available at the time of going to press. Services of the older regional libraries are given in Table 5.

In Newfoundland there are 25 centres which act as regional distributing depots under the supervision of a provincial regional librarian with headquarters at St. John's. The most recent statistics on these libraries show 35,000 volumes, 15,205 borrowers and 141,064 loans.

Staffs.—The personnel employed by the public and regional libraries included about 1,400 librarians and their assistants engaged in full-time work, supplemented by more than 1,000 persons working on a part-time basis. About one-third of the full-time staff had professional rating—a Bachelor of Library Science degree or

an equivalent diploma. In addition, 184 staff members, or about 13 p.c. of the total, had taken courses of training ranging in length from six weeks to less than a year.

Salary schedules have recently improved considerably, especially in the larger cities where more than 40 p.c. of the employees have full professional training. On the basis of duties and responsibilities, the median salaries of the full-time personnel of public libraries in the cities were as follows:—

<i>Population of City</i>	<i>Chief Librarians</i>	<i>Heads of Branches or Divisions</i>	<i>Other Librarians</i>	<i>Other Classifications</i>
	\$	\$	\$	\$
10,000 - 24,999.....	2,667	1,950	1,563	1,375
25,000 - 99,999.....	3,550	2,491	1,772	1,577
100,000 or over.....	4,417	3,000	2,070	1,618

Expenditures on salaries represented more than 50 p.c. of total library expenditures for 1949. In cities over 100,000 population, salaries accounted for 54 p.c. of the total budget; the second group of cities reported 53 p.c., and the smaller cities 50 p.c.

Children's Libraries.—One of the primary objectives of the libraries in Canada is guidance in the formation of good reading habits. This work is begun in the children's departments of the libraries, in special children's libraries, and in the schools. Efforts are made to interest children in the public libraries by attractive quarters and special programs conducted by persons with specialized training and particular aptitude for this work. Some 320,000 boys and girls were registered borrowers from the public libraries in 1949, and each read an average of 18 books during the year.

Auxiliary Services.—In recent years the public libraries have supplemented their main services with educational and cultural programs in music, fine arts and related subjects. Audio-visual programs are now a part of the services of the public libraries in many centres. More than 30 city libraries provided film services for their communities in 1949. The films are owned by the libraries or are on deposit from the National Film Board for circulation in the area. Some 32,000 programs, with audiences totalling 3,739,990 people, were reported by the libraries including those held in the libraries and those sponsored by community organizations outside.

Increasing use of the libraries is made for public meetings. About 700 public lectures, 316 forums and 2,387 meetings were held in public libraries during 1949.

Income and Expenditures.—Local taxes represented 81 p.c. of current income from all sources. Grants from the provinces have increased six-fold in recent years to the point where they now represent more than 10 p.c. of all income in comparison with slightly more than 3 p.c. in 1941. Total expenditures in 1949 were two and one-quarter times those of 1941 and about \$1,000,000 in excess of those of the previous biennium. At that, the current expenditures on public libraries represent only 35 cents per capita—a rate varying considerably in the different provinces: Ontario 65 cents, British Columbia 56 cents, Alberta 32 cents, Manitoba 25 cents, Saskatchewan 23 cents, Prince Edward Island 21 cents, Quebec 14 cents, New Brunswick seven cents and Nova Scotia four cents. The new regional libraries in Nova Scotia and Saskatchewan are, however, not included in the above rates.

The per capita rate established by library authorities for minimum services is \$1, and for maximum services \$4. While no province has as yet reached the minimum rate, it is encouraging to note that the per capita rate for all of Canada in 1949 was double that of 1941.

Academic Libraries.—University and college libraries, 90 in English-language institutions and 88 in French-language institutions, reported 6,314,000 volumes in 1949. This represented less than 100 volumes for each full-time university-grade student in Canada. Fourteen of these libraries had more than 100,000 volumes, 13 libraries reported from 50,000 to 99,000 volumes and 36 libraries reported 25,000 to 49,000 volumes. The remaining 115 libraries had under 25,000 volumes, 61 of them containing under 10,000 volumes.

Centralization of book stock in certain cities presents a major problem to post-graduate students and scholars in Canada. It is a prime factor in the establishment of the National Union Catalogue mentioned earlier and in the ultimate establishment of a National Library in Canada.

On the basis of the returns from libraries for 1949, an estimate was made of the library resources available to university students in the cities where the larger universities are located. The libraries included in the estimate are the academic libraries, the reference departments of the public libraries and the government and special libraries considered of value to university students. The results show the comparative poverty of book resources for certain of these areas. The volumes available per full-time university student, including both undergraduate and post-graduate students, were as follows: Ottawa 530, Quebec city 278, London 246, Hamilton 198, Montreal 162, Halifax 130, Kingston 113, Toronto 108, Winnipeg 90, Fredericton 75, Saskatoon 60, Vancouver 53 and Edmonton 51. The students registered in these cities represent 87 p.c. of all university-grade students in the full-time session.

Government Libraries.—Returns for 1949-50 were received from 59 libraries supported by the Federal Government, 38 of them at Ottawa, and from 34 libraries supported by provincial governments. The Library of Parliament with more than 500,000 volumes represented 23 p.c. of the total of 1,915,302 volumes reported by the federal libraries. The provincial libraries, considerably fewer in number, reported 1,020,416 volumes.

Section 5.—Canada and the United Nations Educational, Scientific and Cultural Organization

The Sixth General Conference of United Nations Educational, Scientific and Cultural Organization, which was held at Paris in the summer of 1951, agreed on certain projects and made administrative decisions which are of particular interest to Canada.

In the field of education the decision to extend the co-operation of UNESCO to the Programs of Technical Assistance of the United Nations illustrates the co-ordination of action which Canada endeavours to promote between the UN Specialized Agencies in order to obtain concentration of effort and, hence, better results. The assistance which the Secretariat of UNESCO will be able to provide to Member States in organizing regional seminars on adult education by sending suitable documentation, by preparing working papers and by providing the services of experts, is also considered an appropriate initiative.

The most important recent change in the administrative field was the decision to hold the General Conferences every two years rather than annually in order to have more time between Conferences to carry out the projects and to survey their progress. The admittance to UNESCO of the German Federal Republic, Japan, the Kingdom of Laos, the Kingdom of Cambodia and the State of Viet Nam brought the total number of Member States to 64.

Direct relations between the Government of Canada and UNESCO are conducted by the Department of External Affairs. Canadian participation includes the work of Canadian delegations to the General Conferences, the administration of UNESCO fellowships and scholarships tenable in Canada, the selection of Canadian delegates to international seminars sponsored by UNESCO, assistance in the organization of seminars in Canada, and the distribution of UNESCO publications to interested associations and educational institutions.

Since signing the instrument of admission to UNESCO, Canada has supported many measures designed to help the agency accomplish its work in a consistent and practical way and has contributed money, time and specialist personnel. In addition to its regular annual contribution (\$319,022 in 1952), Canada, in 1947, made available to the Canadian Council for Reconstruction through UNESCO a sum of \$200,000 for the purchase of materials "for the purposes of educational, scientific and cultural reconstruction". This was the beginning of a happy co-operation between the Government of Canada and some 30 voluntary associations which joined their forces in the establishment of a specialized institution (CCRU) to assist in educational and cultural relief and reconstruction.

Following a joint appeal to the Canadian public by the National Council for the United Nations Appeal for Children in Canada and the CCRU, an additional amount of \$939,250 was received by CCRU to further its educational reconstruction program which included projects to collect books in Canada for universities abroad, to supply artists in foreign countries with essential materials, and to bring students from abroad to Canada on scholarships. A number of direct grants amounting to \$190,186 were made by CCRU to various Canadian and foreign institutions engaged in educational reconstruction.

In brief, Canada has tried to maintain a well-balanced contribution to UNESCO. The support given to the activities of this agency is considered an essential part of Canadian support of the United Nations general program of peace, well-being and security.

PART III.—SCIENTIFIC AND INDUSTRIAL RESEARCH*

Section 1.—The National Research Council

Organized research in Canada on a national basis dates from 1916 when the Canadian Government established the Honorary Advisory Council for Scientific and Industrial Research under a Committee of the Privy Council. Provision was made thereby for the planning and integration of research work, the organization of co-operative investigations, post-graduate training of research workers, and the prosecution of research through grants-in-aid to university professors. This was the basis of the Council's work from 1916 to 1924.

* Prepared under the direction of E. W. R. Steacie, O.B.E., M.Sc., Ph.D., D.S.C., F.R.S.C., F.R.S., President, National Research Council.

A Special Committee of Parliament was appointed to study a recommendation for the establishment of national laboratories and endorsed the proposal but financial difficulties intervened. However, public opinion made it possible to have the Research Council Act passed by Parliament in 1924. Temporary laboratories were secured and research on the utilization of magnesian limestones for refractories was carried out so successfully that a wartime industry, established during World War I, was re-established on a large scale. As a result, in 1929-30 the Government provided funds for new laboratories.

The National Research Building on Sussex Street, Ottawa, was opened in 1932 and in 1939 construction was begun of the aerodynamics building on a 130-acre site adjacent to the Ottawa Air Station. Later several other buildings were erected on this site, including separate laboratories for research on engines, gas and oil, hydraulics, structures, and wood-working and metal-working shops. Since then these facilities have been enlarged and extended and new buildings have been provided for engineering, low-temperature studies and high-speed aerodynamics. In 1951-52, construction was proceeding on applied chemistry laboratories, a thermodynamics building, offices and laboratories for the Division of Building Research, and an extensive laboratory building for the Division of Radio and Electrical Engineering.

The Atomic Energy Project at Chalk River, Ont., also was administered by the National Research Council from Feb. 1, 1947, to Mar. 31, 1952. On Apr. 1, 1952, operation of the atomic energy project was assumed by a new Crown company, Atomic Energy of Canada Limited, and proceeded as previously under policies laid down by the Atomic Energy Control Board. The President of the new Company is C. J. Mackenzie, C.M.G., F.R.S.

A Prairie Regional Laboratory, constructed on the campus of the University of Saskatchewan, was opened in June 1948, and a Maritime Regional Laboratory is under construction on Dalhousie University campus at Halifax, N.S.

The National Research Council consists of the President, two Vice-Presidents (Scientific), one Vice-President (Administration) and sixteen other members, each of the latter group being appointed for a term of three years and chosen to represent industry, labour or research in one of the basic natural sciences. Many of the members are drawn from the science departments of Canadian universities.

In addition to its basic research functions, the Council operates an Information Service with a field staff of technical officers who assist the smaller industries across Canada in bringing their operating problems to the attention of the Council. With the extensive library facilities available to the Council, it is usually possible to provide the required information at very short notice.

The Council aids industry in two other important ways. A free and constant flow of personnel and information is maintained between the Council laboratories and industrial laboratories, the aim being to have Canadian industry use the Council's laboratories just as the units of a large company use their own laboratories as sources of scientific information and assistance. The Council also undertakes for any firm, under contract, research problems that cannot be solved by private consulting and testing laboratories, and also obtains assistance, in return, from many companies. The Council has long-standing and intimate contacts of this co-operative kind with many Canadian industries in many fields, most notably in refractories, oils, metals, chemicals and transport.

Associate Committees were established by the National Research Council early in its history and have been continued to date. Throughout the years, hundreds of specialists have accepted invitations from the Council to serve on committees and have brought the wealth of their knowledge and experience to bear on the solution of research problems put before them. Members give their time and effort to these special studies without fee or recompense, and their assistance is a source of great strength to the Council.

Assisted research grants have been made by the Council since its inception in 1916. These awards are given to heads of university science departments for the purchase of needed equipment and the employment of junior helpers, usually students. Aid of this kind has been of considerable assistance in enabling the universities to put into operation the excellent graduate schools that now exist in Canada.

Scholarships and fellowships for graduate work in science and medicine, granted in 1951-52, included 57 bursaries (\$600), 73 studentships (\$900), 29 fellowships (\$1,200), 17 special scholarships of varying amounts, and six post-doctorate overseas fellowships. In addition, 27 medical-research fellowships and two dental fellowships were awarded. Medical research is carried on by means of grants to accredited workers and fellowships for graduate research in the various medical schools and university hospitals.

Principal Activities, 1951-52.—The threat of unsettled foreign relations once again began to make itself felt during 1950 and Canada, in common with other members of the United Nations, was compelled to divert considerable industrial and other activities along defence production lines, and to orient its research organization accordingly to provide the best possible aid to the military services. The emphasis on defence production needs during 1950-51 at the National Research laboratories, at Ottawa, was chiefly in aeronautical, building, and radar research and to a less extent in applied chemistry, applied biology, physics, and information services.

A large part of the laboratory research in chemistry and physics carried on at the National Research Council laboratories is now being done under the post-doctorate fellowship plan inaugurated in 1948 and developed since that time. In the Chemistry Division particularly, a substantial proportion of the salary allotment is reserved each year for the employment of post-doctorate fellows, recruited from the universities of the world, to work with members of the regular staff. The scheme has been very successful, providing as it does for a continuous turnover of younger men with a variety of training.

In June 1951, the post-doctorate fellows employed in the laboratories included 56 scientists from 24 universities of 12 countries. Distribution of fellows by Divisions was as follows: Chemistry, 34; Physics, 17; Radio and Electrical Engineering, 1; and 4 at the Atomic Energy Project, Chalk River, Ont.

The post-war growth of the aviation industry and the current world situation called for increased effort in aeronautical research for defence purposes and led to the creation in January 1951 of a National Aeronautical Establishment and the formation of a National Aeronautical Research Committee. The Committee is under the chairmanship of the President of the National Research Council and the other members are the Chairman of the Defence Research Board, the Chief of Air Staff, Royal Canadian Air Force, and the Chairman of the Air Transport Board. The objective of the Establishment is the achievement of an orderly development of facilities in aeronautical research and a closer integration of military and civil requirements in this field.

The National Aeronautical Establishment will be administered as a joint military and civil establishment and will be operated by the National Research Council as a separate agency along lines somewhat similar to those on which it operated the Atomic Energy Project at Chalk River. Administration policy will be determined by the National Aeronautical Research Committee. Thus, members of the staff of the aeronautical laboratories will serve in a dual capacity; on peacetime problems they will work as Council employees and, on military projects, as members of staff of the National Aeronautical Establishment.

Despite the necessity of their active participation in the defence preparedness program, the Council's several laboratory divisions continued during 1951-52 to carry on an impressive amount of peacetime research on a wide variety of subjects. Staff, including 1,200 at Chalk River, was maintained at a level of about 3,000. Included in this total were 825 university graduates, of whom 440 held the bachelor's degree, 160 the master's, and 225 the doctorate degree in science.

A few highlights from the 1951-52 reports of the several laboratory divisions give some idea of the variety of work undertaken and the wide scope of the National Research Council's interests.

Atomic Energy.—The Atomic Energy Project has been preoccupied with the detailed design of a new nuclear reactor to be constructed at Chalk River, Ont. This is a heavy water reactor like the existing NRX pile, but of greater power and improved design.

Operation of the NRX pile has been improved and its high flux of neutrons has been applied to many special investigations. A major advance has been applied to unravel complex sequences of radioactive disintegrations. An event which follows another even by less than a thousandth of a micro-second can be distinguished and timed by electronic circuits used with scintillation counters. This has been applied in studying the radioactive isotopes thulium-170, gold-199, iodine-131, and neptunium-239.

Hitherto undiscovered isotopes have been identified as a result of certain reactions in the NRX pile. These include calcium-41 with a half-life of 120,000 years and actinium-229 with a half-life of 66 minutes.

In co-operation with the Department of Agriculture, insects have been tagged with sufficient radioactive cobalt to be detectable 13 feet away. Observers equipped with counters, which register radioactivity as clicks in earphones, have followed marked insects liberated in the bush to see how far and fast they travel. Radioactive phosphorus was injected into sawfly larvæ infected with parasites, and the radioactivity was still detectable in the second generation of parasites.

Mechanical Engineering.—Supersonic tunnels have been built in the Division of Mechanical Engineering. The first of these wind tunnels for work on high-speed aircraft has been placed in operation and is being tuned up. The tunnel has a working section 10" x 10" in which speeds up to five times the speed of sound can be obtained. A second tunnel now being built has a larger working section, 16" x 30", and will have a range up to three times the speed of sound.

A laboratory for work on gas turbines, compressors and combustion is nearing completion and the heavy equipment is under construction. Fuels for gas turbines, Canadian crudes as a source of gas turbine fuels, combustion, thrust augmentation, blading and application to locomotives are some of the studies being made. Present aircraft gas turbines are being tested at low temperatures and different methods

are being investigated for their protection against icing. Canadian fighters and transports are being tested in co-operation with the Royal Canadian Air Force and aircraft firms, very comprehensive instrumentation having been designed and built for this work.

The model-testing basin for work on ship models has been very active with investigations proceeding both for the Royal Canadian Navy and for the shipbuilding industry. Studies in the latter field have included the design and operation of lake bulk-freighters, an ice-breaking ferry, fishing boats, and shallow-draft tugs.

Building Research.—Construction has been started on a laboratory and office building at Ottawa for the Division of Building Research. The Division's research station at Saskatoon, Sask., began regular operation during 1951, and first results of tests on wood-frame walls with air spaces will be published early in 1952. Studies on building in the North were continued and plans are being made for a permafrost research station. A draft of the first section of the revised National Building Code is now being circulated throughout Canada.

Experimental work on concrete slab foundations for houses without basements was begun in 1951, at Ottawa. Two slabs have been constructed, each heated electrically and carrying a building comparable to conventional house construction.

Development of test sites to study the effects of weather on various building materials in selected locations has been continued, and it is expected that all sites will be equipped and in use by the end of 1952. The appointment of a climatologist to the Division staff has further emphasized the importance of climate in relation to building research. Work on the correlation of the performance of standard test huts with climate has been expanded to include huts at Churchill, Man., and at Pennsylvania State College, U.S.A.

The Division co-operates with other government agencies on problems allied with building research. Special studies have been made for the Department of National Defence and many technical problems of the Central Mortgage and Housing Corporation have been investigated.

Radio and Electrical Engineering.—The Division of Radio and Electrical Engineering is very active in defence production work. In connection with radar and its application to artillery fire control, satisfactory progress has been made in redesigning experimental equipment, in engineered form, suitable for industrial production. Detection of aircraft by radar is also being highly developed. A recent redesign of a mobile medium-range radar used during World War II is now going into production on a large scale.

Work is proceeding on the design and positioning of "suppressed" antennæ to ensure their perfect performance on high-speed aircraft where the aerodynamic drag of external radio antennæ is so great that it is necessary to enclose them within the skin of the aircraft.

NRC's million-volt impulse generator is being used continuously for testing electric power-transmission equipment. The generator applies sudden high-voltage impulses, similar to lightning strokes, to power-line insulators, transformers and cables. The need for better insulating materials in the electrical industry in Canada requires, in turn, the development of accurate methods of testing materials already available. NRC is working on methods of testing transformer insulating oil and on the difficult problem of electrical breakdown characteristics of liquids.

Power supplied commercially to most types of electrical apparatus is subject to undesirable fluctuations. Regulators combining electrical and mechanical methods are used, but such stabilizers are not suitable for use with precision electronic instruments because they react too slowly. A new type has been developed which can correct supply fluctuations within one-tenth of a second, and maintain an output of several kilowatts constant within a fraction of one percent.

Applied Biology.—Work in applied biology includes investigations on food preservation, the synthesis, composition and utilization of plant and animal products, the effects of environment on animals, and statistical interpretation of biological data. A few examples follow.

Citric acid is now being produced on a laboratory scale by submerged mould fermentation of sugar-beet molasses. Seventy percent of the sugar is converted to acid in less than three days. This fermentation rate is about three times as high as that of other known methods. High-temperature treatment of certain vegetable oils has resulted in improved flavour stability but with some decrease in nutritive value. Taste tests of frozen whole milk and of frozen evaporated milks prepared by two different methods indicate that the whole milk keeps better. The keeping qualities of the evaporated milks are affected by the method of concentration.

When foods and certain other biological materials are quick-frozen for preservation, the question arises as to whether the ice formed becomes continuous throughout the frozen material. Work with an artificial system indicates that cell membranes, or concentrated cell saps may act as barriers to continuous ice formation thus preventing loss of flavour on thawing.

The work of the Prairie Regional Laboratory at Saskatoon, Sask., is closely allied with the Applied Biology Division at Ottawa. New antibiotic and enzyme-producing fermentations are being studied there, and radioactive tracers are being used to obtain a better understanding of certain fermentation mechanisms. Many bacterial antibiotics have been checked for possible use in the control of plant diseases in western Canada.

Crop utilization studies include work on starches, proteins, oils from rapeseed, flax, sunflower and similar crops, and the straw residue. Methods have been developed for the production of undenatured gluten for use in improving the baking properties of lower grade wheat flours. Fibre wallboard produced in a pilot plant using straw as the pulp material has proven superior to standard commercial boards.

Chemistry.—Corrosion of metals is a long-term study in the Division of Chemistry. A survey is being made of the various types of corrosion inhibitors used in automotive cooling systems. Typical inhibitors proposed for use in new and reclaimed antifreeze solutions are being tested.

Investigations are proceeding on the quality of motor-vehicle paints and test methods are being developed for the assessment of insulating varnishes, finishes for electronic equipment, undercoatings for vehicles, and fire-retardant paints which are used on structures where the fire hazard is an important consideration.

In the field of aviation, the Division has won recognition for its rain-repellent preparation, FC-10, for use on aeroplane windcreens. Lately, the procedure for applying this preparation has been further simplified.

Mothproofing of fabrics is of great importance, not only to the householder, but also to the military services because of the necessity of storing and shipping clothing consisting of wool or part-wool fabrics. Shrink-resistant treatment for

wool textiles is another laboratory problem. Blending of wool with other fibres, notably nylon, gives a more serviceable product. Recommendations of the textile laboratory have been incorporated in purchase specifications for army socks.

In organic chemistry, the structures of two new alkaloids, thermopsine and rhombifoline have been elucidated, and a new type of alkaloidal structure has been synthesized. An infra-red microscope has been designed and made with which it is possible to identify one one-hundredth of a milligram of an organic compound by its infra-red absorption spectrum. The instrument is being used in the study of the metabolism of cortisone and other steroid hormones.

Physics.—In the Division of Physics, one of the problems worked on during 1951-52 was concerned with improving the efficiency of fog horns. By the use of modern acoustical theory, it was found possible to make certain changes, and one of these, the exponential horn, showed an improvement of efficiency by a factor of 20 compared with previous installations. Another horn of the catenoidal design was found to be 59 p.c. better than the one of exponential shape. To attain the full efficiency of the new horns, careful regulation of pitch is required.

Extensive studies of cosmic rays are being made from recordings of Geiger counters at an Arctic post and at Ottawa to obtain information on the relationship between cosmic-ray activity and meteorological and magnetic conditions, and to aid in unravelling the mysteries of the atomic nucleus. Another research group is using photographic emulsions to record collisions between cosmic rays and atomic nuclei. Evidence has been obtained which indicates that both charged and neutral mesons (subatomic particles) are emitted when a cosmic ray strikes the nucleus of an atom. Further work may shed light on elementary interactions between particles having billions of volts of energy. Cosmic rays offer the simplest method for this study.

Valuable information on the genesis of mica and the age of the earth is being obtained by X-ray diffraction studies of the nucleus of dark circles, called pleochroic haloes, which frequently appear in mica.

Successful experiments, designed to secure information needed for the construction of a new type of radiation unit for cancer treatment, have been concluded using two large radioactive cobalt sources.

Increased accuracy in temperature measurements, important to industry, has been obtained by the precise determination of certain fixed points on the International Temperature Scale. The Division can now establish, with the highest accuracy, temperatures over a range of more than 1,000°.

Spectroscopic studies of light emitted by chemical compounds have been used to increase the available information on their molecular structure. Investigations have been completed in nitric oxide, aluminium chloride, nitrous oxide, methyl chloroform, methyl cyanide, and pyridine. An improved method of producing sulphur monoxide has been developed and the structure of this compound has been accurately established; it contains two sulphur atoms and two oxygen atoms instead of one of each as might have been assumed on other bases. Examination of the composition of distant planets this year yielded a new discovery when some features in the spectra of the planets Uranus and Neptune were reproduced in the laboratory and it was thereby shown that hydrogen is abundant in the atmospheres of these planets. Work in theoretical physics is laying a firm foundation for the correlation of results of scientific speculation with experimental data.

Section 2.—Other Scientific and Industrial Research Facilities

Aside from the work of the National Research Council, which is the central national research organization, research is carried on by the Departments of Agriculture, Mines and Technical Surveys, Resources and Development, Fisheries, the Board of Grain Commissioners and the Dominion Observatories. These bodies have trained permanent scientific staffs for investigation and research in their own fields. The research and experimentation carried on by the Science Service of the Department of Agriculture is outlined in Chapter X, pp. 381-382. The work of the Experimental Farms System is described at pp. 349-352 of the 1948-49 edition of the Year Book. Specialized work in scientific forest research is described in Chapter XI, pp. 460-463. Investigational work carried on by the Department of Fisheries and the Fisheries Research Board are given in Chapter XIV, pp. 572-575.

The Board of Grain Commissioners employs a staff of seven chemists and 21 assistants in the main research laboratories for milling, baking, malting, etc., while the Dominion Observatories carry out research in the fields of solar physics, astrophysics, seismology, terrestrial magnetism, gravity and other studies.

A Defence Research Board was established in 1947 to correlate the Special Scientific requirements of the Armed Forces with the scientific research activities carried on by the National Research Council and industry generally. The research stations of the Board deal with only those problems that are peculiar to national defence, collaborating with existing research facilities in other fields. The organization of the Board is covered in Chap. XXVII.

Universities often show bold initiative in exploring the field of scientific research but with the limited facilities at their disposal the task of carrying their discoveries to a conclusion is not always easy. Government and industrial laboratories are often able to pick up and carry on where the universities leave off.

A number of research foundations have their own special fields of research. The Ontario Research Foundation at Toronto, Ont., established in 1928, is an independent non-profit-seeking scientific organization available to the public and to industry for assistance in matters of a technological character.

The Banting Research Foundation supports the work of the Banting and Best Chair of Medical Research in the University of Toronto and aids medical research throughout Canada.

The Rockefeller Foundation assists various agencies in Canada in the furtherance of scientific research in medical science, natural science, social science and public health.

CHAPTER IX.—SURVEY OF PRODUCTION*

CONSPECTUS

	PAGE		PAGE
SECTION 1. INDUSTRIAL DISTRIBUTION OF PRODUCTION.....	368	SECTION 3. DISTRIBUTION OF INDUSTRIAL PRODUCTION IN EACH PROVINCE.....	373
SECTION 2. PROVINCIAL DISTRIBUTION OF PRODUCTION.....	371		

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

The scope of the Survey of Production is limited to the actual production of commodities. The activities of such industries as transportation, communication, trade, finance and service are entirely excluded. This is in contrast to the scope of Gross National Production which encompasses all industries. Net production, or "value added", is generally considered the most significant measure of production and is consequently stressed in the following analysis. It is obtained by deducting from the total value of output for each industry, the cost of materials, fuel, purchased electricity and process supplies consumed in the production process.† This measurement comes closest to representing the concept involved in the contribution of each industry to gross national product at factor cost. Apart from variations in the statistical structure, the main difference is that value added, as computed for each commodity-producing industry, includes the cost of such services as insurance, advertising, transportation, communications, etc. In the compilation of the national accounts, the contribution of these services to gross national production at factor cost is classified to the non-commodity industries from which they originate.

The 1949 national totals include Newfoundland's production for forestry, mining, electric power, construction and manufactures. Statistics on agriculture, fishing, trapping and custom and repair for that Province are not yet available.

Current Trends.—In 1949, net value of commodity production in Canada broke all records as it rose to nearly \$10,000,000,000, a gain of about 7 p.c. over the total value recorded in 1948‡ and 250 p.c. over the 1938 level. The total net value rose steadily from \$2,859,000,000 in 1938 to a wartime peak of \$6,737,000,000 in 1944. After a moderate recession occasioned by the problems of conversion to peacetime production, it resumed its rapid advance in 1947. Higher prices accounted for the greater part of the gain over 1948, although there was some increase in volume in the majority of industries. Estimates indicate that further

* Prepared in the Business Statistics Section, Research and Development Division, Dominion Bureau of Statistics.

† A description of the method used in computing gross and net production figures is given in D.B.S. Bulletin *Survey of Production*.

‡ Nearly \$75,000,000 of the 1949 increase was due to the inclusion of part of Newfoundland's value of production.

expansion in production was achieved in 1950 and 1951. Between 1949 and 1950, the volume index of industrial production rose more than 7 p.c. and preliminary calculations show that an additional rise of about 7 p.c. occurred in 1951. Wholesale prices in 1950 averaged about 6 p.c. higher than in 1949 and registered a further advance of nearly 14 p.c. in 1951. After a slight increase in 1950, total non-agricultural employment rose approximately 7 p.c. in 1951. Although the value of agricultural production levelled off in 1950 as compared with 1949, near-record grain crops in 1951 resulted in a considerable advance in the value of farm output.

Substantially higher price levels, sustained demand for consumer goods both in Canada and abroad, the rapid development of the industrialization program and, more recently, the outbreak of hostilities in Korea and the subsequent expansion of defence industries have all contributed to record high levels of production in the post-war years.

Section 1.—Industrial Distribution of Production

The figures in Table 1 show that the net value of Canadian commodity production in most industrial groups rose considerably during the post-war period. Value of net output in the mining, construction and manufacturing industries advanced rapidly from 1946 to peak levels in 1949. The 90 p.c. gain in the value of mineral production in that comparison was the result of both higher prices and expanded physical output. High levels of building activity and the rapid advance in costs of construction combined to account for the marked advance of 161 p.c. in the total for the construction industry. The net value of manufacturing production in 1949 was over 50 p.c. higher than in 1946. In this case, the greater part of the increase was due to higher prices although volume of output rose nearly 15 p.c. The electric-power industry expanded steadily over the period, although the value rose at a more moderate pace since it was less influenced by the increase in prices. In the agriculture and forestry groups, net value receded slightly in 1949 from the record levels of 1948, but remained far above the 1946 totals. The value of the fisheries industry, after rising moderately in 1947 and 1948 recorded a drop in 1949, and returns from trapping showed a tendency to decline.

Table 1 classifies industry into primary and secondary production, although there is a certain amount of duplication since many stages of manufacturing are closely connected with primary activities. Fish-packing plants, for instance, are operated in close relationship with the fishing fleets, sawmills and pulp and paper mills with forest operations, and smelters and refineries with metal mining. The net values of production of such processing industries are given separately in Table 3 to show the degree of this duplication between primary industries and manufactures which is eliminated in Tables 1 and 2.

1.—Net Values of Production, by Industries, 1944-49

NOTE.—Net production represents total value under a particular heading, less the cost of materials, fuel, purchased electricity and supplies consumed in the production process.

¹ Excludes Newfoundland.

In 1949, manufacturing continued to be by far the leading group in producing new wealth. Although its position was less predominant than in the wartime economy of 1944, manufacturing still accounted for more than one-half of the total net value of commodity production in 1949. Agriculture remained the second most productive group, contributing about 20 p.c. of total net value. The relative importance of the forestry and the construction industries increased significantly since 1938; in 1949, each of these groups accounted for over 10 p.c. of the total. On the other hand, the mining and electric power industries showed declines, contributing 8 p.c. and 3 p.c., respectively, to the Canadian aggregate in 1949 compared with 13 p.c. and 5 p.c. in 1938.

Section 2.—Provincial Distribution of Production

In the 1946-49 period, each of the provinces (Newfoundland excluded) recorded a substantial increase in net value of output. Ontario, Alberta and Saskatchewan showed the greatest advances, amounting in each case to about 60 p.c. The smallest gain was recorded by Prince Edward Island.

In 1948 each province reached a peak level of production. During 1949, Ontario, Quebec, Nova Scotia and Alberta, made further substantial increases, New Brunswick, Prince Edward Island and Saskatchewan rose more moderately, and Manitoba and British Columbia recorded small recessions. As a result of the higher increases in Ontario, Quebec and Nova Scotia in 1949, these provinces gained in relative importance, their advances being proportionately greater than for Canada as a whole. Manitoba and British Columbia, having shown absolute declines, lost considerable ground, while the other provinces whose gains were lower than the total gain also dropped somewhat in relative importance.

Per Capita Production.—Per capita net value of production in Canada (exclusive of Newfoundland) in 1949 reached \$757, which surpassed by almost 4 p.c. the previous record of \$729 established in 1948. From 1938 to 1949 the population

of Canada increased by about 17.5 p.c. which may be compared with a rise of 247 p.c. in the net value of production. Per capita output increased from \$256 to \$757 in that period, or by about 196 p.c.

Per capita production in the three Maritime Provinces was well below the national average throughout the period. New Brunswick and Prince Edward Island, however, recorded slightly higher percentage advances than Canada as a whole, but per capita production in Nova Scotia failed to increase as rapidly. Among the provinces, Nova Scotia, New Brunswick and Prince Edward Island occupied seventh, eighth and ninth positions, respectively, in 1949.

Per capita net output in Quebec was \$674 in 1949, a figure somewhat below the Canada average. During the 1938-49 period, however, it rose 197 p.c. compared with the 196 p.c. rise for all Canada. The Province ranked fifth in value of output per capita in 1949, dropping from fourth position in 1938. Per capita production in Ontario rose to \$940 in 1949, continuing well in advance of any other province. The increase since 1938 was nearly 175 p.c., somewhat less than the national average.

Per capita output in Manitoba, amounting to \$631 in 1949, increased well over 200 p.c. since 1938, but remained rather moderate as compared with the Canada average. The Province, ranking fifth in 1938, was sixth in 1949. The fact that 1938 was a depression year for the agricultural economy of Saskatchewan accounts partly for the large percentage gain of 467 p.c. by 1949 in the per capita production of that Province. In the latter year, Saskatchewan ranked fourth in Canada with an output per capita amounting to \$743. The population of the Province actually decreased nearly 9 p.c. during that period. Alberta's per capita output in 1949 was recorded at \$785, the second highest in the country. Production in that Province rose rapidly over the period 1938-49 though the population gained only 13 p.c.

Per capita output in British Columbia in 1949, at \$781, was third highest in Canada. The great advance since 1938 was accompanied by a population increase of nearly 44 p.c.

Section 3.—Distribution of Industrial Production in Each Province*

Maritime Provinces.—In Prince Edward Island, the net value of agricultural production, the main source of income, contributed about 59 p.c. of the total value in 1949 and showed little change from the previous year. The relative importance of the industry was slightly less than it was in 1938 when it accounted for 61 p.c. of the net output of the Province. A decline from the previous year in the value of fisheries was offset by increased construction activity. In Nova Scotia, more than one-half the rise from 1948 in the value of net output was accounted for by an increase in construction. Declines were recorded in forestry and fisheries while other industries advanced moderately. Compared with 1938, the relative importance of construction and manufactures gained markedly at the expense of agriculture, mining and electric power. In New Brunswick, a drop in the output of the important forestry industry in 1949, compared with the previous year, was offset by a gain in construction. As in Nova Scotia, the secondary industries contributed more to the Province's total net value in 1949 than in the pre-war year of 1938.

Quebec.—The manufactures group, which contributed 63 p.c. of provincial net production in 1949, recorded a gain of nearly 8 p.c. over the previous year and the value of construction advanced more than 34 p.c. The decline in forestry output was offset by an increase in mineral production, while agriculture showed little change. Here also, the primary industries—agriculture, mining and electric power—lost ground to construction and manufactures in the 1938-49 comparison. By contrast, the contribution of the forestry industry was greater than in 1938.

Ontario.—All the principal industries except forestry showed a higher value of output in 1949 than in 1948. The value of manufactures and construction rose 9 p.c. and 27 p.c., respectively, and mining advanced nearly 16 p.c. The relative importance of agriculture and mining in 1949 amounted to 13 p.c. and 6.4 p.c., respectively, compared with 15 p.c. and 14.5 p.c. in 1938. By contrast the contribution of construction and manufactures rose from 6 p.c. and 60 p.c., respectively, to 11 p.c. and 66 p.c. in the same comparison. Forestry also improved its position while the value of electric power lost in relative importance.

Prairie Provinces.—Agriculture continued to dominate the economy of the Prairie Provinces in 1949. In Manitoba, the decline of about 12 p.c. in 1949 from the preceding year in the value of agricultural output was mainly responsible for the drop in the total net output of the Province. In the 1938-49 comparison, the changes in the relative importance of mining and construction were the most marked features. In the pre-war year, the contribution of mining was 10.6 p.c. and that of construction 4.4 p.c. The positions were reversed in 1949, mineral production dropping to 4.1 p.c. and construction advancing to 10.8 p.c.

In Saskatchewan, the drop in the value of mining in 1949 from 1948 was more than offset by advances in agriculture and construction. The relative position of agriculture in Saskatchewan increased from 67 p.c. in 1938 to 77 p.c. in 1949. In contrast to the other provinces, the contribution of the secondary industries declined considerably during that period.

* This analysis takes no account of the deductions for the elimination of duplication between different groups.

In Alberta, the value of mineral production jumped sharply in 1949 over 1948 and, together with a considerable gain in construction, resulted in a higher net output despite a drop in the value of agriculture. The relative importance of mining, construction and manufacturing in the 1938-49 period gained at the expense of agriculture, the contribution of the latter having dropped from 63 p.c. to 52 p.c.

British Columbia.—Net value of production fell off slightly in 1949 from the peak established in 1948. Declines were recorded in forestry, fisheries, trapping, mining and manufacturing; the recession in mining amounted to 16 p.c. The net value of construction, however, rose nearly 19 p.c. The relative importance of all primary industries, except forestry, declined in 1949 from their 1938 positions, the drop in mining being especially notable. By contrast, the contribution of construction and manufactures, following the trend in most other provinces, rose considerably. The relative importance of construction advanced from 5 p.c. in 1938 to 13 p.c. in 1949 while that of manufactures jumped from 38 p.c. to 47 p.c. in the same comparison.

7.—Net Values of Production in Each Province, classified by Industries, 1948 and 1949

NOTE.—Figures available for Newfoundland for 1949 are as follows: forestry, \$38,709,853; mining, \$17,471,590; electric power, \$1,910,629; construction, \$8,196,000; and manufactures, \$32,918,776.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Agriculture, including stock raising and horticulture, is the most important of the primary industries of the Canadian people, employing, according to the Census of 1951, 15.6 p.c. of the total labour force and 20.0 p.c. of the labour force males. In addition, agriculture provides the raw materials for many Canadian manufactures, and its products in raw or manufactured form constitute a very large percentage of Canada's exports. The present and potential agricultural land is shown by provinces at p. 19 of this volume.

Section 1.—Federal Government in Relation to Agriculture*

The creation of the Department of Agriculture is provided for in Sect. 95 of the British North America Act (1867), which says, in part, that "in each province, the legislature may make laws in relation to agriculture in the province" and that "the Parliament of Canada may from time to time make laws in relation to agriculture in all or any of the provinces; and any law of the legislature of a province relative to agriculture, shall have effect in and for the province as long and as far as it is not repugnant to any Act of the Parliament of Canada". As a result of this provision, there exists at the present time a Department of Agriculture, with a Minister of Agriculture at its head, in the Federal Government and in each of the provinces except Newfoundland where agricultural affairs are dealt with by the Agricultural Division of the Department of Natural Resources. The Federal Department was established in 1868.

At present there are four main fields of activity: (1) general policy, including security and price stability; (2) research and experimentation; (3) maintenance of standards and protection of products; and (4) reclamation and development. The first three fields are dealt with in the following subsections, while reclamation and development is covered in Section 3, pp. 393-405.

* Except as otherwise indicated, this material was prepared under the direction of Dr. J. G. Taggart, C.B.E., Deputy Minister of Agriculture.

Policies and projects conducted under these headings are co-ordinated within the Department and with similar work done by other departments and institutions, both federal and provincial. The results of work in these various fields and information on the policies of the Department in general are given to farmers and to the public through bulletins, the press, radio and the screen.

Generally, Canadian farmers entered 1952 in a strong financial position and at no time has farm investment been on a sounder foundation. Many long-term commitments have been liquidated, or have been considerably reduced, and a large quantity of farm machinery and equipment has been acquired, mostly for cash or on large down-payments. Farmers have never been so well represented as they are to-day through national and provincial organizations and co-operatives, nor have they been so well protected by measures for security in marketing as they are by legislation passed by Parliament during the past decade.

Subsection 1.—General Policy and Price Support

The most important of the special Acts passed in recent years to assist the farmer are described below.

Agricultural Prices Support Act, 1944.—Under this Act, the Federal Government, acting through a Board, may stabilize the price of any agricultural product (except wheat, which is handled separately) by outright purchase or by underwriting the market through guarantees or deficiency payments. The net cost of operations under the Act, from its inception to the end of 1951, has been approximately \$10,000,000, although at times the Board has had title to products valued at more than \$35,000,000.

Agricultural Products Board Act, 1951.—This Act authorizes the establishment of a Board to buy, sell, export and import agricultural products when directed by the Governor in Council. When so designated by the Agricultural Prices Support Board, the Board may act as agent for the purchase and disposal of agricultural products under provisions of the Agricultural Prices Support Act.

Agricultural Products Co-operative Marketing Act, 1939.—This Act aids farmers in pooling returns from the sale of their products by guaranteeing initial payments and thus assisting in orderly marketing. The legislation has been used extensively by co-operatives, and agreements throughout the years have covered onions, potatoes, corn, many seed crops, and ranch-bred fox and mink pelts.

Agricultural Products Marketing Act, 1949.—A number of provincial governments have passed legislation providing for the establishment of a board to regulate or control the marketing of agricultural products produced and marketed within the province concerned. The Agricultural Products Marketing Act permits such provincial marketing legislation to be applied in the same way to the marketing of agricultural products outside that province and in export trade.

Prairie Farm Assistance Act, 1939.—The Federal Government under this legislation makes cash payments each year to farmers in areas within the Prairie Provinces that have had low crop yields because of drought or other causes. The award to a farmer is based upon the acreage of the farm and the average yield of wheat in the township in which the farm is located. The maximum amount payable on any one farm is \$500. Contributory payments are made by the farmers in the form of a levy of 1 p.c. on the value of all grains marketed. Additional amounts required are provided from the Consolidated Revenue Fund.

Potato Warehouses.—A policy was inaugurated in 1947 whereby the Federal Government provides cash assistance in respect to potato warehouses constructed by co-operative associations. The assistance is conditional upon the association providing an agreed amount, the Federal Government and the provincial government concerned sharing the remainder. All warehouses must have the approval of a federal-provincial committee set up for the purpose in each province in which warehouses are to be built under this policy.

The Cheese and Cheese Factory Improvement Act, 1939.—The purpose of this Act is to encourage the improvement of cheese factories and the quality of cheese production. A quality premium of one cent per pound is paid on cheddar cheese scoring 93 points and two cents per pound on cheese scoring 94 points or over. Under this Act the Federal Government may grant up to 50 p.c. of the amount expended for new material, new equipment and labour utilized in the construction, reconstruction and equipping of cheese factories eligible for a subsidy. This subsidy applies in the case of amalgamation of two or more existing cheese factories provided that the replaced cheese factories cease to operate as such prior to the payment of the grant. The Act also provides for paying 50 p.c. of the cost expended in efficiently insulating and enlarging cheese-curing rooms, either with or without mechanical refrigeration. Also, in order to standardize the size of cheese manufactured in the various factories, the Act provides for paying 50 p.c. of the cost of replacing cheese hoops where factories are using hoops of a diameter other than 15 inches. The cost of adjusting or replacing other equipment occasioned by the changeover is also included in the subsidy.

Cold Storage Act.—This Act provides financial assistance in the construction of public cold-storage warehouses in localities where it is considered that such warehouses are in the interests of the public.

Farm Credit.—The Federal Government has made provision for the extension of credit to farmers under the Canadian Farm Loan Act and under the Farm Improvement Loans Act. The Prairie Grain Producers' Interim Financing Act, 1951, was emergency legislation intended primarily to relieve any hardship caused by the extremely unfavourable harvesting conditions of that autumn (see p. 381).

*The Canadian Farm Loan Act, 1929.**—Long-term farm mortgage credit is made available to Canadian farmers under the provisions of this Act, which is administered by the Canadian Farm Loan Board. The Board makes loans for the purchase of live stock, farm equipment and farm land, for improvements, for refinancing debts and for operating expenses. The Board also provides short- and intermediate-term credit to its long-term mortgage borrowers by means of five-year second mortgages with collateral chattel security.

From the commencement of operations in 1929 to Mar. 31, 1951, the Board has lent \$74,960,000. During the first ten years the annual average was \$3,860,000, but borrowing declined during the war years, reaching a low of \$1,215,450 in 1943. Since then it has increased to a high of \$5,189,400 for the year ended Mar. 31, 1950, but the amount approved in the year ended Mar. 31, 1951, was \$4,722,000. The trend in recent years has been toward decreased borrowing to pay debts and increased borrowing to purchase land and equipment.

* Revised by W. A. Reeve, Secretary, Canadian Farm Loan Board.

1.—Loans Approved and Disbursed under the Canadian Farm Loan Act, Years Ended Mar. 31, 1942-51

NOTE.—Figures for 1930 are given at p. 186 of the 1940 Year Book and those for 1931-41 at p. 189 of the 1942 edition.

Totals.....	1,796	4,312,450	680	409,550	4,722,000	7,558,636	3,729,546	11,288,182

The main forms of financial assistance provided at the present time by the Federal Government to farmers for housing purposes include: the Canadian Farm Loan Act outlined above, the National Housing Act and the Farm Improvement Loans Act dealt with under Construction, and the Veterans' Land Act, under Veterans Affairs (*see Index*).

*The Farm Improvement Loans Act, 1944.**—The Farm Improvement Loans Act is designed to provide intermediate-term credit and a type of short-term credit to farmers to enable them to equip, improve and develop their farms. There is scarcely anything a farmer wants in the way of mechanical aids for his farm operation or his home for which a loan may not be made. Assistance may also be obtained

* Prepared by D. M. McRae, Supervisor, Farm Improvement Loans Act, Department of Finance.

for the purchase of live stock, principally foundation or breeding stock; for installation or repair of farm electric systems; for repair, alteration or construction of farm buildings, including the home; and for fencing, drainage and other development projects. The Act is intended to assist the farmer who previously has not been able to obtain adequate credit for such purposes. Moreover, credit is provided on security and terms that are convenient and suited to the individual borrower.

The chartered banks are the lending agency under the Act. This legislation, originally operating for three years, was extended in February 1948 for a further three-year period. During these six years the Government guaranteed each bank against loss in an amount equal to 10 p.c. of the total of all loans made by the bank. The amount of the guarantee was limited to \$250,000,000. In February 1951, the Act was again extended for three years and the guarantee was set at \$200,000,000. Up to Dec. 31, 1951, 54 claims amounting to \$26,230 were paid under the guarantee.

Loans may be obtained for periods of up to seven years with maximum interest at 5 p.c. The maximum amount that may be on loan to a borrower at any one time is \$3,000. Also, the borrower must himself provide 20 p.c. to 33 p.c. of the cost of his project. The Act is administered by the Department of Finance.

Loans made from the inception of the Act to Dec. 31, 1951, were:—

Year	Loans		Amount
	No.		\$
1945 (10 months).....	4,311		3,381,742
1946.....	13,030		9,880,566
1947.....	22,046		18,160,821
1948.....	30,431		29,331,131
1949.....	44,775		45,879,080
1950.....	58,969		63,421,363
1951.....	75,063		85,326,227
TOTALS.....	248,625		255,380,930

By Dec. 31, 1951, \$153,714,985, or over 60 p.c. of the total of all loans made, had been repaid. Of the loans made during the first three years of operation, all but 1.3 p.c. had been repaid; of those made during the second three years, all but 27 p.c. had been repaid.

3.—Loans made under the Farm Improvement Loans Act, classified by Purposes. 1945-51

Prairie Grain Producers' Interim Financing Act, 1951.—This Act, which came into force Jan. 15, 1952, provides short-term credit to grain producers in the Prairie Provinces who, because of congested delivery points or inability to complete harvesting of their grain, are in need of credit until their grain can be delivered. Individual advances can be made to a maximum of \$1,000.

Subsection 2.—Agricultural Research and Experimentation

The Department of Agriculture conducts, on a broad scale, scientific research and experimentation on the control of pests and diseases, the nutritional requirements of plants and animals, the breeding and testing of new varieties, the microbiology of soils and foods, investigations of crop production and cultural methods, and many other matters. This work is carried on mainly by the Science Service and the Experimental Farms Service. In addition to providing information on current production problems, the work is of paramount importance to the long-time well-being of agriculture.

Conservation of the soil is of basic importance to agriculture. Research in that field takes the form of soil surveys and study of methods for protecting and conserving soil resources and is carried on in collaboration with the provincial governments. Studies include the chemistry of the soil, cover crops, value of manure and fertilizers, cultural methods, use of tillage machinery and development of large land-reclamation projects.

The Department has for many years conducted investigations into the control of insects and diseases of forest trees. The limited silvicultural work carried on has been done with the aim of maintaining a supply of trees suitable for planting on the prairies as shelter belts against the wind and to prevent soil and snow drifting. Basically, this is also a soil-conservation measure.

As might be expected, much of the research and experimental work carried on is concerned with crop plants for, after the soil itself, they are of chief importance. This work includes the breeding and testing of suitable varieties of crops to be grown under the varying climatic conditions throughout Canada. Their culture, their nutritional value and, in the case of food crops and their suitability for human consumption—even their appeal, or lack of appeal, to a somewhat discerning housewife—are continuously under study.

Work on live stock includes mainly the feeding, care and handling of stock, its protection from insects and diseases, and the production of suitable market and breeding types. A limited amount of work has been done on the production of new strains of animals.

Research and study of processed products such as milk, butter, cheese and meat, and of fruits and vegetables is a most active item in the scientific work of the Department. Storage of agricultural products creates many problems that call for constant study.

Chemical and biological research and experimentation is mainly of an applied nature. That is, the Department does not specialize in so-called fundamental research involving the discovery of basic scientific phenomena and laws, but concentrates mainly on the adoption of known processes and the application of such processes to specific aims. At the same time, some discoveries bordering on fundamental research are occasionally made, and it is also found necessary to extend to some degree into the fundamental field where certain information is lacking in applied science.

Agricultural research, particularly in plant science, must be decentralized to a great extent for most problems must be studied where they occur. Apart from the value to farmers of having a local source of information, the experimental farms and science laboratories are widely distributed because the work can be done in no other way. In addition to the headquarters of the Experimental Farms Service at Ottawa, work is carried on at 28 branch experimental farms and 20 substations. Experimental work of local application is done at 162 illustration stations, 54 district substations and 11 fox and mink illustration stations. The work of the Science Service, centralized at Ottawa, is also augmented by about 100 laboratories throughout the country, including the recently opened laboratories of Insect Pathology at Sault Ste. Marie, Ont., and the Science Service Laboratory at London, Ont.

In the field of economic research, studies in farm management, land utilization marketing and farm-family living are undertaken in all parts of the country. The scope of the scientific and experimental work of the Department is revealed when it is realized that there is no plant or animal in Canada that is not susceptible to damage by disease caused by bacteria, fungi or viruses, or subject to attacks by insects or, in the case of animals, by internal parasites. Also, that the work of the agricultural scientist is never done may be illustrated by the appearance of a new stem rust of wheat (Race 15B) which attacks varieties previously found to be rust resistant. The only answer to this menace is the development of a new resistant strain necessitating an intensive breeding program. The answers to many such problems are found only after years of continuous study and investigation.

Subsection 3.—Protection and Grading

Unlike manufactured articles, even close scrutiny of most agricultural products is no clue to their purity as food, or their value to the farmer for further production. Obviously, products that are eventually used as food must be pure and healthy and must come up to standards of quality established for them. On the other hand, if agriculture is to be conducted on a sound basis, the supplies farmers buy—seed feeds, fertilizers and pesticides—must also carry some guarantee that they will be as represented. Much of the research and experimental work would go for naught if legislation were not provided to see that the end-product of such work was satisfactory.

factory. In addition, Canada's live stock, crops and trees must be protected from diseases that might be introduced with importations from other countries, or that might originate in Canada.

These protective and grading services are a most important part of the work of the Department of Agriculture. They come under two sections, the Production Service and the Marketing Service, and the necessary authority is gained from about 20 Acts or their regulations. Generally, the protective features and the grading to standards or approval of analyses of farm supplies come under the Production Service. The grading of most food products is the responsibility of the Marketing Service.

Health of Animals.—The protection of the health of Canada's live stock is a most important service. To guard against the introduction of contagious diseases from foreign lands stringent regulations are enforced by the Health of Animals Division covering the importation of live stock, live-stock products and even packing material and litter. Provision is also made for the control or eradication of animal diseases developing within Canada. The Division is responsible for the inspection of animals slaughtered for food, and post-mortem examination is made on all carcasses in the course of slaughter and dressing before the meat is approved for human consumption. Sanitary conditions in packing plants and slaughter houses come under review and all canned meats must meet high standards of processing to qualify as food.

Protection of Supplies.—The Plant Products Division, in co-operation with the provinces and other agencies, is primarily concerned with the administration of Acts respecting feeding stuffs, fertilizers, pesticides, hay and straw, fibre flax and binder twine, and the production of seed. The inspection services of the Division have three main functions: (1) to enforce the Acts that regulate the sale of the agricultural supplies; (2) to provide, as required, such services as seed-crop inspection and the sealing of seed produced from inspected and other approved crops; (3) to co-operate with provincial governments and other agencies in promoting and improving supplies of seeds, feeds, fertilizers and pesticides.

Visual inspection is of little value for most of these products and laboratory testing is necessary; the laboratory services of the Division maintain branch offices across Canada. In the case of seeds it is a complex matter, for they must be tested for germination, variety, purity and freedom from weeds and other kinds of seeds before they are graded. All feeding stuffs, fertilizers and pesticides are subject to registration, and this is refused if products would be dangerous in use, if the ingredients or analyses are unsatisfactory, or if the claims made regarding their value are incorrect or misleading.

Plant Protection.—The Division of Plant Protection functions with regard to plants and plant products much as the Health of Animals Division does with animals and administers the Destructive Insect and Pest Act. Imported nursery stock and plant material are all subject to inspection as protection against the introduction of insects and diseases. Extensive inspection is maintained within Canada to identify, localize and exterminate dangerous enemies of crops and trees. Provision is also made for the inspection of potato crops to be used for seed, both for the domestic and the export market, and for the issuance of health certificates required for a wide range of plant products.

Standards and Inspection.—For 50 years or more, the Department has been steadily establishing and improving standards of quality for agricultural products. This work originated in an effort to improve the quality of export commodities and has gradually extended to include many products that move in interprovincial trade. The provinces have in most cases adopted these standards for enforcement within their respective areas on products marketed intraprovincially.

Grade standards are established and enforced for dairy products, meats, eggs and poultry, fruits and vegetables (canned and processed, and seed). Grade standards are widely recognized outside Canada and many Canadian foods and agricultural products command premium prices because of the strict quality standards maintained.

Dairy Products.—The grading and inspection services of the Dairy Products Division is somewhat typical of other sections of the Marketing Service engaged in such work. Cheddar cheese, creamery butter and dry skimmed milk must be graded before being exported; in practice this means practically all the cheddar cheese, 60 p.c. of the creamery butter and 82 p.c. of the dry skimmed milk. In addition, creamery print butter is branded as to grade in nine provinces. Dairy products are required to meet standards of composition, be of correct weight or volume and be described accurately in accordance with the provisions of the Dairy Industry Act and regulations thereunder. In the case of condensed, evaporated and dried milk products, technical assistance is given on manufacturing and sanitation problems.

Meats.—In addition to the approval of carcasses for human consumption, inspection and grading of meats is of importance. All hogs marketed at stockyards and plants are rail graded, that is, the farmer is paid on the dressed weight and quality of the carcass. Export bacon is inspected as well as other export meat and meat products. The better grades of beef are marked according to standards of Choice and Good beef, making them eligible for marketing as Red and Blue brands respectively. Lamb carcasses are graded on an optional basis, and wool is inspected and graded in some 23 registered wool warehouses.

Eggs and Poultry.—Registered egg-grading stations are the basic units in the grading and packing of eggs; registered poultry-processing and eviscerating stations are the basic units in the processing, eviscerating, grading and packing of poultry and registered egg-breaking stations are the basic units in the processing, grading and packing of frozen egg products. These stations have been brought to a high standard of efficiency with regard to sanitation, equipment, temperature control, grading and packaging.

Inspection of eggs, poultry and frozen egg products is compulsory on all sizable quantities intended for export. Inspection is compulsory for interprovincial shipments of poultry of 10,000 lb. or over. These products are also check-inspected periodically for grade when offered for sale at wholesale and retail. The sale of eggs by grade, at retail, is compulsory throughout Canada, and the sale of poultry by grade, at retail, is compulsory in many of the larger consuming centres.

Canned boneless poultry for interprovincial and export shipment must be packed according to grade and prepared in registered canneries. Registered poultry canneries also operate on a high standard of efficiency with respect to sanitation, temperature control, cooking procedure, packaging, etc.

Fruits and Vegetables.—A commercial inspection service covering fresh fruits and vegetables is provided and dealers and brokers handling these commodities in interprovincial, export and import trade are licensed and are subject to established regulations.

The fruit and vegetable canning and processing industry has made great strides in the past quarter-century. In 1950, 558 plants were licensed to operate, and produced processed fruits and vegetables valued at \$161,000,000. The inspection of these plants, the testing of the products and the grading is done by the Canning Section of the Fruit and Vegetable Division.

Maple Products and Honey.—Regulations are established for the inspection, analysis and grading of these products. Maple products manufacturers and sugar-bush owners, operating interprovincially or for export, are licensed. To prevent the possibility of adulteration of maple syrup and sugar, inspection is made of manufacturing plants, stores and restaurants. Interprovincial and export shippers of honey are registered.

Subsection 4.—Canada's Relationship with FAO

The Food and Agriculture Organization of the United Nations (FAO) was conceived at a special United Nations Conference at Hot Springs, Virginia, in May-June 1943, and brought into being at Quebec in October 1945. Its objectives include the raising of levels of nutrition and standards of living of the peoples of all countries, improvement in the efficiency of production and distribution of farm, forest and fisheries products, and the betterment of the conditions of rural populations. Membership in the Organization expanded from 42 member nations in 1945 to 68 at the end of 1951.

FAO is governed by a Conference in which each member nation has one vote. The Conference meets every second year and between sessions a Council acts for the Conference. The Council has 18 members, elected for a period of two years. The work is directed by a Director-General who, with the Chairman of the Council, is elected by the Conference for a two-year term of office. Under the Director-General are the General Secretariat, Special Assistants and the Area Liaison Service which includes the regional offices for North America, Latin America, Asia and the Far East, and the Near East and European areas. The Organization is divided into five technical Divisions: agriculture, economics, fisheries, forestry and nutrition.

FAO carries out four major types of activity. (1) It serves as a world extension or advisory service mobilizing modern scientific knowledge for increased production, improved handling and processing, and better distribution of food and other farm, forest and fisheries products. Much of the work is concerned with the economic development of underdeveloped areas. (2) It serves as a forum for bringing governments together for organizing international action. (3) It provides all governments, to the limits of its facilities, with facts and figures relating to food, agriculture, forestry, fisheries and nutrition. (4) It endeavours to appraise the outlook for production and consumption and the likely developments of international trade in food and agricultural commodities.

In the field of economic development, experts, scientists and investigating missions are supplied at the request of member countries to work in the country concerned on problems that are hindering its development. Through this program

of technical assistance, FAO, by December 1951, had signed 144 basic agreements with 48 countries or territories; 226 experts were either at work in these countries or had returned from their short-term assignments, and 45 additional specialists had been recruited or were on their way to take up their duties. While 107 requests remained to be filled, this was either because the work was seasonal or because requesting governments were not yet ready to initiate the studies. Of the total number of experts in the field on that date whose assignments were completed or whose appointments were pending, 143 were connected with agriculture, 42 with forestry, 11 with fisheries, 20 with nutrition, 21 were lecturers and instructors and 9 were administrative field personnel.

Associated with the provision of experts is a Fellowship Program covering some 30 countries providing for 260 fellowships to be granted to responsible government officials or senior professional men already familiar with the work being done or to be undertaken. Where technical assistance is supplied, the salary and travelling expenses to and from the country in which the expert is to work is paid by FAO; the contracting country meets other expenses. FAO itself is financed through contributions of member countries on a percentage basis.

Canada, as an important agricultural producer and exporter, has maintained a close interest in FAO and has played a prominent role in its development. A Canadian was a member of the original Executive Committee of the Organization and Canada has had continuous representation on the 18-member Council which replaced that Committee. Canadians are on most of the standing advisory technical committees and have taken part in many of the technical missions sent to underdeveloped countries. Canada has been able to provide considerable technical assistance to other nations through FAO and has benefited materially in return from the technical and statistical information supplied by FAO and through participation in discussions on national and international policies relating to agricultural production and distribution.

In its seventh year of operation in 1952, FAO has slowly but surely become firmly established. The preliminary surveys of requirements have been completed and the ideals and aims of the Hot Springs Conference are beginning to unfold into achievement on a practical scale. Food production is lagging still and it will take some time for many projects of FAO to demonstrate their full value. In many cases results will not be complete for generations in fertilization, irrigation and reclamation projects to bring soils and forests into productivity. The task of FAO is unceasing; it is in the vanguard of the march toward international betterment of mankind.

The permanent headquarters for the organization was established at Rome, Italy, in 1951. The Sixth Conference was held at that city, Nov. 19-Dec. 6, 1951.

Section 2.—Provincial Governments in Relation to Agriculture

Subsection 1.—Agricultural Services

Newfoundland.—Since 1934, government agricultural services in Newfoundland have been operated by the Agricultural Division of the Department of Natural Resources. The Division maintains an extension service and encourages agricultural development by the payment of bonuses for the purchase of pure-bred sires and for the clearing of land, assistance with agricultural exhibitions, the payment of subsidies on live stock and the conducting of a soil-survey service. Each year

* Information supplied by the agricultural authorities of the various provinces.

several scholarships are awarded to young men enabling them to take a four-year degree course in agriculture. Government policy relating to land settlement affecting both civilians and war veterans, and the scheme of assistance to farmers in clearing land with government-owned tractors are administered by the Land Development Division of the Department of Natural Resources.

Prince Edward Island.—The Department of Agriculture is presided over by a Minister, assisted by a Deputy Minister, a Dairy Inspector, a Pathologist and Veterinarian, a Soil Assistant, five County Representatives and a Superintendent of Women's Institutes.

Nova Scotia.—Provincial agricultural policies in Nova Scotia are administered by the Department of Agriculture and Marketing, with the Minister's Office and those of the Deputy Minister, the Director of Marketing Services and the Superintendent of Agricultural Services located at Halifax. The Department is composed of several Branches, each headed by a Director. The Branches include: Agricultural Engineering Services; Animal and Poultry Services; Chemistry, Soils and Fertilizer Services; Dairy Services; Extension Services; Field Crops Services; Horticultural and Biological Services; Immigration and Land Settlement Services; and Marketing Services. With the exception of the agricultural representatives who are located in the 18 county offices, all technical officials are located at the Nova Scotia Agricultural College, Truro.

New Brunswick.—Provincial Government policy concerning agriculture in New Brunswick is directed by the Department of Agriculture. This Department has as its head the Minister of Agriculture who is assisted by a Deputy Minister and the Directors of the following services: extension, live stock, dairy, veterinary, poultry, horticulture, field husbandry, soils and crops, plant protection and promotion, agricultural engineering, home economics, Credit Union Co-operative Association, agricultural education, apiculture and agricultural societies.

Quebec.—The Department of Agriculture of Quebec comprises ten services: education, rural economics, extension, animal husbandry, horticulture, field husbandry, information and research, handicrafts and home economics, health of animals and rural engineering. Each service is divided into sections dealing with particular problems. The Department also includes many other special organizations such as the Farm Credit Bureau, the Research Council, the Rural Electrification Bureau and the Dairy Industry Commission.

The annual competition for the Agricultural Merit Order, organized in 1890, is held alternately in each of five regions. Honours and awards are conferred upon the operators of the best kept farms. More than 5,000 farmers have participated in the competition since its inception. County Farm Improvement Contests, started about 1930, have brought about most gratifying results on over 5,000 farms and remain very popular. Each contest lasts five years during which time farms are completely transformed and their production greatly increased.

Soil-improvement policies include large drainage projects carried out by the Department and smaller projects by groups of farmers with government help. Over 500,000 acres have been reclaimed or improved in the past few years. Financial and mechanical assistance is given for land clearing, stoning, levelling and terracing. Grants are also available for underground drainage, liming, etc.

Various forms of assistance are offered towards crop and live-stock improvement. An artificial insemination station operates at St. Hyacinthe for the benefit of breeders' clubs. Plant-breeding stations for cereal and forage crops are maintained at Macdonald College and for vegetables and small fruits at Ste. Foy, near Quebec City. Trained specialists, with main laboratories at Quebec and field laboratories in different districts or schools, are employed in the work of curbing the enemies of plant and animal health.

Agricultural co-operation is widespread in Quebec. There are 610 co-operatives with 69,829 members; 90 agricultural societies (27,000 members) look after local interests and organize county exhibitions. There are also in operation 900 Cercles de Fermières (Women's Institutes) with a membership of 50,000, 500 farmers' clubs with a membership of 25,982, and numerous junior farmer clubs.

Farm credit, established in 1936, accepts about 2,000 loans each year, two-thirds of which are used to facilitate the settlement of young farmers. Special grants are also available to farmers starting their sons on new farms.

Ontario.—The Ontario Department of Agriculture provides financial assistance and administrative services to agriculture through its Head Office, 12 branches, three Experimental Farms, and through research and extension work carried out at the four educational institutions under its administration. In addition to general administration, the Head Office administers the policies providing assistance to farmers and settlers in northern Ontario in connection with land breaking and clearing, and with improving farms and live stock. (1) The Live Stock Branch promotes live-stock improvement policies, licenses and examines stallions and gives support to pure-bred live-stock associations; (2) the Crops, Seeds and Weeds Branch assists in the development of good cultural practices and promotes the use of improved strains of seed, the improvement of pastures, and the eradication of weeds; (3) the Dairy Branch provides an inspection, instruction and supervision service to all dairy factories and promotes the production of clean milk on farms; (4) the Farm Economics Branch conducts cost studies on agricultural production in co-operation with agricultural organizations; (5) the Fruit Branch enforces fruit and vegetable regulations, provides information to growers, and administers the Co-operative Marketing Loans Act; (6) the Co-operation and Markets Branch administers the Farm Products Control Act, the Credit Unions Act, the Ontario Food Terminal Act and the Farm Products Containers Act; (7) the Milk Control Board, under the Milk Control Act, regulates and supervises the marketing of fluid milk; (8) the Agricultural and Horticultural Societies Branch gives assistance to agricultural and horticultural fairs and exhibitions, plowing matches and other competitions, and administers the Community Centres Act; (9) the Agricultural Representatives Branch carries on an educational and extension service through agricultural representatives located in all counties and districts and gives direction to club work carried on with farm youth; (10) the Women's Institute Branch and Home Economics Service gives leadership and direction to organized activities of rural women; (11) the Statistics and Publications Branch, in co-operation with the Dominion Bureau of Statistics, provides a crop-reporting service and gathers and disseminates data on crops, live stock and dairy products; (12) the Ontario Farm Labour Service assists farmers in securing help during the busy seasons, particularly at harvest time. The Horticultural Experiment Station at Vineland, the Western Ontario Experimental Farm and Agricultural School at Ridgetown, the Demonstration

Farm at New Liskeard, the Kemptville Agricultural School, the Ontario Agricultural College and the Ontario Veterinary College at Guelph, all under the administration of the Department, provide research and extension services to Ontario Agriculture.

Manitoba.—The Department of Agriculture of Manitoba serves through the following branches: agricultural extension; live stock; dairy; agricultural publications and statistics; weeds administration; co-operative services; and the provincial veterinary laboratory.

The Extension Service deals with agronomy, horticulture, poultry, agricultural engineering, beekeeping, junior live stock, boys' and girls' clubs and women's work, with specialists devoting their attention to these subjects. Meetings, field days and short courses are held throughout the Province. There are 30 agricultural representatives located throughout the Province, each representative serving from one to five municipalities.

The Live Stock Branch administers the Animal Husbandry Act, develops and administers policies which encourage the improvement and production of live stock, and works in close co-operation with the Veterinary Laboratory Service and the Dominion Health of Animals Division in the control of live-stock diseases.

The Dairy Branch administers the Dairy Act, supervises the grading of cream, inspects creameries and cheese factories, gives instruction in cheese- and butter-making, issues licences to makers of dairy products and to cream graders and conducts a dairy-cost study among milk producers. Extension activities include addressing meetings and preparing articles and leaflets on dairy farm problems.

The Agricultural Publications and Statistics Branch publishes and distributes, annually, approximately 100,000 bulletins, circulars, posters, leaflets, etc.

The Weeds Administration Branch directs the activities of 18 municipal weed-control units comprising 70 rural municipalities engaged in eradicating deep-rooted, persistent perennial weeds; supervises weed demonstrations; investigates weed problems; conducts weed surveys; and prepares weed literature, radio addresses, articles, pictures, mounted weed specimens, etc.

The Co-operative Services Branch takes care of the registration and supervision of co-operatives and credit unions and the administration of the Acts governing them. The Branch also gathers and compiles statistics on co-operative activity throughout the Province. The Director is Secretary of the Co-operative Promotions Board.

The Veterinary Laboratory operates a diagnostic laboratory for animal diseases, the services of which are available to veterinarians and live-stock owners.

Saskatchewan.—The Saskatchewan Department of Agriculture is organized into six Branches. (1) The Administration Branch conducts daily farm-information radio programs over seven private stations and, in co-operation with the Dominion Bureau of Statistics, gathers data on crop conditions, production, marketing and income. (2) The Agricultural Representative Service has a field staff of 37 Agricultural Representatives, four District Supervisors and specialists in farm mechanics and visual aids. Agricultural Representatives, working with municipal agricultural and conservation committees, study local problems and determine their needs; the Department pays one-half the costs of local development projects. Assistance is given to farm people through meetings, visits, the press and radio in respect to the use and conservation of soil and water resources, and the production of crops, live stock, poultry and bees. Agricultural Representatives are active in all federal, provincial

and university farm services under the Saskatchewan Co-operative Agricultural Extension Program. Co-operation is maintained with the Federal Department of Labour and the National Employment Service in directing large annual movements of farm labour in and out of the Province. (3) The Conservation and Development Branch is responsible for the engineering, farming and land development activities of the Department, including irrigation and drainage programs conducted in co-operation with the Federal Government and irrigation on departmental and privately owned projects. Reclamation of land by drainage, development of misused land and under-utilized land, and construction of provincial community pastures all come within its jurisdiction. The Branch administers the Farm Implement Act and provides engineering service for conservation and water-control projects. (4) The Lands Branch classifies all Crown land according to the use for which it is best suited; disposes of such land under long-term leases or by inclusion in land-utilization projects; collects rentals for land under disposition; clears and breaks plots made available for settlement; and operates community pastures. (5) The Plant Industry Branch organizes and administers programs for crop improvement and crop protection, and advises on seed and crop improvement, soil erosion, horticultural problems and weed control. The improvement of grassland is promoted through a forage crop program. The Seed Plant Division carries on custom cleaning of forage seeds and registered cereals. The Apiary Division advises on beekeeping and honey production, carries on continuous inspection for American foul brood and supervises grading. (6) The Animal Industry Branch includes four divisions. The Dairy Division administers dairy herd improvement programs and assists producers with management and production problems; inspects and licenses dairy manufacturing and frozen-food locker plants; and administers dairy, locker-plant and margarine legislation. The Livestock Division encourages the use of suitable animals for breeding purposes by the establishment of pure-bred sire areas and by assistance in the purchase and distribution of stallions, bulls, boars and rams. It registers brands, bonds and licenses live-stock dealers and agents and promotes programs on insect control, feeding and management. The Poultry Division maintains flock-testing and turkey-grading services; administers an approved hatchery policy, licenses and bonds produce dealers and poultry buyers, hatcheries and hatchery agents. It also assists with poultry shows and field days and generally promotes flock improvement. The Veterinary Division assists students in veterinary science under a scholarship plan, administers disease-testing and vaccination programs and co-operates with Federal Government officials and local veterinarians in disease prevention and control.

Alberta.—The Alberta Department of Agriculture is organized as follows. (1) The Field Crops Branch deals with all matters pertaining to the utilization of soil and production of crops. A Commissioner of Field Crops and four Supervisors administer programs and policies relating to crop improvement, soil conservation and weed control, crop protection and pest control, and horticulture. Agricultural Service Boards of municipalities assist in implementing field-crop policies of local concern. The Department is represented on each Board. (2) The Live Stock Branch aids in maintaining the quality of herds and flocks by assisting farmers in securing pure-bred herd sires and maintaining an artificial insemination laboratory. The work of the Branch includes the inspection of stallions, the supervision of live-stock feeder association, and the administration of legislation relating to stock inspection brands, domestic animals and the sale of horned cattle. (3) The Dairy Branch administers the Dairymen's Act and the Frozen Food Locker Act. Grading and

purchasing of raw produce by all dairy plants are under regulation, as well as standards of construction, manufacture, processing, sanitation and temperature control for dairies and frozen-food lockers. A regular cow-testing service is available to dairy producers and the Branch laboratory provides facilities for chemical and bacteriological analyses needed for industrial directives. Yearly cost studies and dairy farm management services are operating in the principal milk-producing areas. (4) The Poultry Branch carries on programs for the improvement of poultry husbandry, supervises flock approval for the control of pullorum disease, maintains a practical poultry-breeding plant for the distribution of breeding stock and issues all hatchery, wholesale first receiver and trucker licences for the handling of poultry products. (5) The Veterinary Services Branch is responsible for the diagnosis of animal diseases for veterinarians and conducts considerable veterinary extension work. During 1951, approximately 8,500 specimens of live stock and poultry were examined. (6) The Apiculture Branch administers the Bee Diseases Act which requires the registration of all beekeepers and the maintenance of an inspection service. The Branch also carries on a considerable amount of general educational work. (7) The Agricultural Extension Service operates 37 offices and employs the services of 43 District Agriculturists and 13 District Home Economists. The District Agriculturists work with farmers, assisting them with their problems and with departmental policies designed to improve the standard of agricultural practices. The District Home Economists provide a similar service for farm women. Bulletins are prepared dealing with agricultural and home economics topics, together with weekly agricultural notes and a tri-weekly radio program. The Branch, in co-operation with the Federal Department of Labour, is concerned with recruitment and placement of farm labour and is responsible for the supervision of agricultural societies. (8) The Fur Farm Branch administers the licensing and exporting of live animals and pelts and assists fur farmers with problems pertaining to care and management, stock improvement and disease control. Considerable educational work is conducted in the form of meetings, field days, short courses and bulletins. Fur farm inspections are carried out periodically. (9) The Schools of Agriculture Branch administers the operation of three institutions located at Olds, Vermilion and Fairview, which offer practical two-year courses for young men who intend to farm and for young women who plan to become homemakers. During the summer the schools are used for short courses and gatherings of farm people. The Alberta Junior Farm and Home Clubs educate young people in practical phases of farming and homemaking and train them in the essentials of good citizenship. In 1951 there were 426 junior clubs with a membership of 6,575.

British Columbia.—The Department of Agriculture has four main divisions. (1) The Administrative Division is responsible for the general direction of agricultural policies, administration of legislation affecting agriculture, supervision of extension programs, collection of agricultural statistics, compilation of reports and publications, preparation of material for agricultural exhibitions, supervision of farmers' and women's institutes, as well as the carrying out of soil surveys in various sections of the Province. (2) The Animal Industry Division consists of general live-stock, veterinary, dairy and poultry branches and supervises the promotion and improvement of animal production, fur farms, brand inspection, inspection of beef grading, control of contagious diseases of animals, eradication of insect pests detrimental to live stock, and field extension connected with animal nutritional work. (3) The Plant Industry Division includes horticulture, field-crop, plant pathology, entomology and apiculture branches and supervises fruit, vegetable and

seed production and surveys dealing with orchards, small fruits, flowering bulbs and greenhouse areas; also the suppression of insect pests, plant disease inspection with control of noxious weeds and general promotion of crop production. In addition there are field officials in 12 of the principal fruit and vegetable producing areas who undertake extension work on behalf of field crop, fruit and vegetable producers. (4) The Agricultural Development and Extension Division includes field-extension work through the district agriculturist service, clearing agricultural lands for production, agricultural engineering, farm labour supply, and junior club projects. Extension Division officials of the Department are located in 32 agricultural centres throughout the Province.

Subsection 2.—Agricultural Colleges and Schools

All provinces with the exception of Newfoundland and New Brunswick provide facilities for training in agricultural science at university level. Such colleges are administered by either the Department of Agriculture or the Department of Education of the respective province. At the secondary-school level, practical courses in agriculture are included in the high-school curricula of all provinces except Newfoundland. The Province of Quebec provides for such instruction in special schools.

5.—Agricultural Colleges and Schools, by Provinces, 1951

Province	Number and Type	Course
Newfoundland.....	—	—
Prince Edward Island.....	1 Faculty of Agriculture, Prince of Wales College. 1 vocational school.....	2-year course preparatory to third year of degree course at MacDonald College, Que. 1-year and short courses in vocational agriculture.
Nova Scotia.....	1 agricultural college.....	2-year degree course and short-term or correspondence courses in vocational agriculture.
New Brunswick.....	1 vocational school } 3 agricultural schools }	Courses in agriculture and home economics.
Quebec.....	3 agricultural colleges..... 1 provincial veterinary college..... 17 secondary agricultural schools.... 6 agricultural orphanages..... 4 special schools.....	4-year degree and 2-year diploma courses. 4-year degree course. 2 winter terms for farm children. Practical training for prospective farmers. Dairy, veterinary, experimental and fur-farm schools. Short courses and special or refresher courses are offered to farmers by most of these schools.
Ontario.....	1 agricultural college..... 1 college of veterinary science..... 2 agricultural schools.....	4-year degree course in agriculture or household science, 2-year diploma course in agriculture, 1-year course in household science, and short courses in agriculture and household science. 5-year degree course. 2-year diploma course in agriculture One school gives also a 2-year course in household science.

5.—Agricultural Colleges and Schools, by Provinces, 1951—concluded

Province	Number and Type	Course
Manitoba.....	Faculty of Agriculture, University of Manitoba. 1 agricultural and home-making school.	Degree courses in agriculture and household science; 2-year diploma course in agriculture and 1-year course in household science. 1-year diploma courses in agriculture and household science.
Saskatchewan.....	University of Saskatchewan— College of Agriculture..... Farm School of Agriculture..... College of Household Science.....	Degree course in agriculture. Certificate course in agriculture. Degree course in household science.
Alberta.....	Faculty of Agriculture, University of Alberta. 3 agricultural schools.....	Degree courses in agriculture and household science. 2-year vocational courses in farming and home-making, and various short courses.
British Columbia.....	Faculty of Agriculture, University of British Columbia.	Degree course in agriculture.

Section 3.—Agricultural Irrigation and Land Conservation

Subsection 1.—Federal Projects*

PRAIRIE FARM REHABILITATION ACT

The Prairie Farm Rehabilitation Act is a rehabilitation program conceived by Parliament in 1935 to meet the problems of drought and soil drifting adversely affecting agriculture on the Canadian prairies.

Existing agencies of the Government of Canada were assisted, with P.F.R.A. funds, to expand their activities in providing leadership in the immediate drought problems. In particular, cultural investigations were carried out by the Experimental Farms Service to ensure the most economic use of the limited supply of soil moisture for crop production and the prevention of soil drifting farm lands that were a menace to surrounding good land. A program of water conservation to meet immediate needs was also initiated in 1935. Other services, such as the Economics Division, were assisted where special knowledge was required for rehabilitation measures.

The major activities of the P.F.R.A. Administration, with headquarters at Regina, Sask., include the construction, for the Government of Canada, of all projects concerned with water conservation and land utilization in the Prairie Provinces. The four principal phases of investigational study in the field of engineering include surveys (exploration), soil mechanics, drainage and design. These studies are undertaken by P.F.R.A. to gather the fundamental groundwork of technical and other basic information that is required before construction of any project is undertaken. Considerable work in each of these fields of study was undertaken during the year ended Mar. 31, 1952, together with co-operative studies using the services of existing government departments.

Water Conservation

Small and Community Projects.—P.F.R.A. provides engineering and financial assistance to farmers in the construction of water conservation works within drought areas of the three Prairie Provinces as a rehabilitation measure. The

* Prepared under the direction of Dr. J. G. Taggart, C.B.E., Deputy Minister of Agriculture, by G. J. Matte, Associate Director of Rehabilitation.

amount of financial assistance awarded is largely dependent upon the type and size of the project contemplated. At all times the P.F.R.A. policy, with respect to assistance provided, is to assist farmers to rehabilitate themselves. Authority to proceed with construction is first secured through the respective provincial water rights departments. Water conservation projects in this category are classified either as "individual farm projects" or as "community projects" undertaken by a group of farmers.

Individual Farm Projects.—During 17 years of operation P.F.R.A. has provided assistance to farmers to construct 46,759 individual farm projects in the form of dugouts and small dams, many of which are suitable for irrigation. The objective is to provide adequate water-storage facilities where water shortages exist, and to assure dependable water supplies through irrigation for domestic requirements, for stock-watering and for the production of live-stock feed.

Of the 46,759 projects completed by Mar. 31, 1952, 38,416 have been designed as dugouts, 5,928 as stock-watering dams and the remaining 2,415 projects as small irrigation schemes. The construction of these projects has extended the benefits of water to all parts of the dry area. By so doing, a much larger number of farmers have been rehabilitated than would have been possible through the construction of large schemes on well-defined watersheds, and without the movement of settlers from their present holdings. The maintenance of valuable live-stock herds has been secured by assuring dependable water supplies on farm stock-watering projects and through the development of 90,000 acres of irrigated land on small irrigation schemes.

Community Projects.—The development of community projects is necessarily confined within the narrow reaches of well-defined watersheds where sufficient water resources are available. Where groups of farmers organize a water users' association or the rural municipality provides leadership in an irrigation or water-storage project, the P.F.R.A. co-operates with the local body. The usual procedure is for the Government of Canada to assume the capital cost of storage and connecting works and the provincial body to assume the responsibility for the distribution of water to the land or along the watershed. The local body also undertakes maintenance and operation.

To Mar. 31, 1952, P.F.R.A. has provided the necessary assistance to construct 244 community projects. The majority of these are located on six watersheds originating in the three Prairie Provinces. Their purpose is to conserve surplus spring runoff water that flows in streams early in the season to supplement short supply later in the year. By maintaining stream flows, farmers are assured of dependable water supplies for live stock and for irrigation use. In addition, community projects provide homes for farmers moved from submarginal areas to where they can be assured a livelihood.

P.F.R.A.'s responsibility for the development of large community irrigation schemes terminates with the construction of primary reservoirs and connecting canals. In special cases where the need for early returns to farmers proved imminent, P.F.R.A. has assisted further in the development of the irrigable land and has maintained a constant surveillance of the project's operations and progress. At times, agreement has been reached between P.F.R.A. and the provincial government concerned whereby the P.F.R.A. provides engineering and financial assistance to

construct primary works and the province agrees to assist with the development of the irrigable area. Such an agreement is in effect in connection with sections of the Swift Current Irrigation Project being developed in Saskatchewan.

Major Irrigation Projects.—During recent years P.F.R.A. has administered special votes by Parliament for the construction of water conservation and development projects that involve large expenditures of money. These undertakings have extended P.F.R.A. administration beyond the boundaries of the P.F.R.A. area in the three Prairie Provinces into British Columbia.

St. Mary Irrigation Project.—The St. Mary Irrigation project has been undertaken by agreement between the Government of Canada and the Province of Alberta. The Government of Canada has agreed to construct the main supply reservoirs and connecting works. The Province of Alberta has undertaken the responsibility for construction of the auxiliary reservoirs and distributary system from the main works to the land.

The St. Mary River System is by far the most important irrigation project undertaken in Canada and when completed will irrigate an area of approximately 510,000 acres. Construction of the St. Mary Dam, key structure on the whole project, was completed in 1951 and was marked by an official opening July 16, 1951. Built under Canada's share of the Federal-Provincial agreement, the dam stands 195 feet high and 2,536 feet wide, and creates a reservoir capable of storing 320,000 acre-feet of water. The dam, which was a major engineering accomplishment, took five years to construct.

Approximately 150 miles of main canal have been built by the Government of Canada. Ten thousand acres of land have so far been developed as the Province's share under the agreement, together with over 100 miles of the distribution canal system. Further lands will be developed in 1953 and 1954.

South Saskatchewan River Development.—This development in central Saskatchewan is a proposed multiple-purpose project to be used for developing power and irrigation, the irrigable area lying between the town of Elbow and the city of Saskatoon. The key structure on the project will be a dam on the South Saskatchewan River located at a point midway between the towns of Outlook and Elbow.

The plan is to stabilize agriculture in the south-central area of the Province where prolonged droughts have created serious economic problems for over 50,000 farmers. Full use will be made of the river's control, power, urban water supply and recreational benefits. Considerable investigational work has been undertaken on this project, a full report of which was presented to the Government of Canada in 1951.

Bow River Irrigation Project.—The Bow River project was purchased by the Government of Canada in 1950 from the Canada Land and Irrigation Company, a private British interest. Development of this project will ensure water to an existing 57,000 acres of irrigated land and will bring an additional 180,000 acres "under the ditch". The project is being undertaken by the Federal Government in order to rehabilitate hundreds of farmers now residing within drought areas of the prairies. In addition, it is expected that this scheme will serve as a stabilizing influence on agriculture in southern Alberta.

Engineering surveys, drainage studies and soil mechanics investigations, started in 1950, were continued.

Construction activities have been mainly the repair and enlarging of old and worn out structures to meet new and increased demands. Twelve thousand acres of new land in the Hays district of the Bow River irrigation project were prepared for settlement in 1951. A complete irrigation distribution system was installed in the area.

Red Deer Irrigation Project.—The proposed Red Deer River development concerns the irrigation of an estimated 400,000 acres of land located in the east-central part of Alberta. The project will consist of a dam on the Red Deer River at Ardley and about 100 miles of main canal to two main reservoirs—Craig Lake and Hamilton Lake.

The dam will contain power installations to produce power for pumping and also for sale commercially. An estimated 20,000,000 kwh. of water power will be available for sale when fully developed. Engineering topographic and plain table surveys on lands proposed for irrigation are all but completed. Engineering surveys on proposed irrigation works are also nearing a stage of completion and negotiations are under way to finalize all those phases of study pertinent to the development of the project.

Irrigation Development in British Columbia.—Irrigation development in British Columbia has been undertaken in connection with the Veterans' Land Act and at the request of the British Columbia Government. Three projects, namely, the Chase irrigation project and the Johnstone Western Canada ranching projects No. 1 and No. 2, have been completed within the South Thompson Valley area. On these projects, 809 acres of land have been developed for irrigation for the benefit of approximately 40 veterans of World War II.

In the Okanagan Valley three new projects have been completed, the Westbank irrigation project and the Bankhead project near Kelowna, and the Cawston Benches project located east of the town of Keremeos. The three projects irrigate 1,782 acres of land and provide locations for 170 veterans of World War II.

Intensive farming is practiced both in the Okanagan and South Thompson Valleys. The land developed for irrigation by P.F.R.A. will be used mainly for the growing of small fruits and vegetables and for dairying.

New projects are constantly being investigated as potential development areas. During the year ended Mar. 31, 1952, complete investigation reports were completed for: Lister Project, Creston; Grandview Flats Project, Vernon; Black Mountain Irrigation Project, Black Mountain Irrigation District; Salmon Arm Irrigation Project, Salmon Arm; Pitt Meadows Dyking District No. 1, Port Coquitlam; British Columbia Fruitlands Irrigation Project, between Kamloops and Tranquille; and Penticton West Benches Project, Penticton.

Major Reclamation Projects.—*Riding Mountain Reclamation Project.*—Extensive investigations have been undertaken by P.F.R.A. in the Riding Mountain area at the request of the Manitoba Government. A serious flood problem exists on a number of streams flowing off the north and east slopes of Riding Mountain and Duck Mountain, causing damage to a large area of valuable agricultural land. P.F.R.A. was asked to devise and carry out a plan to relieve a land area of over 252,000 acres affected by flooding.

The cost of reclamation in the area is borne jointly by the Government of Canada and the Government of Manitoba. Construction work so far has centred mainly along Edwards and Mink Creeks in the Riding Mountain area. The work consists of clearing and dyking stream channels and straightening the alignment of channels by building stream cutoffs and diversions. The larger portion of the work on these two streams was completed in 1951.

Stream bank erosion studies are also being continued on streams of Riding Mountain to stabilize stream banks and minimize erosion problems. It will be necessary to continue the studies for a number of years before definite results can be presented.

Saskatchewan River Reclamation Project.—Consideration has been given by P.F.R.A. during the past two years to the possibility of successfully reclaiming land for agriculture in the Pasquia area of the Saskatchewan River Delta region near the town of The Pas in Manitoba. Surveys and investigations are under way in the area to determine the feasibility of development. The work is being undertaken pursuant to a request made to the Government of Canada by the Provincial Governments of Manitoba and Saskatchewan.

A preliminary report on survey activities has been prepared and has been submitted to the Manitoba Government for consideration. Preliminary survey results indicate the possibility of reclaiming 96,000 acres of land in the area that would be suitable for cultivation if protected from floods and another 10,000 acres suitable for grazing.

Assiniboine River Project.—This project was undertaken as a direct result of damaging floods that occurred in 1950 in the vicinity of Winnipeg from the Assiniboine and Red Rivers. The project is being undertaken at the request of the Manitoba Government to prevent further flooding on the Assiniboine River, particularly between Brandon and Virden and between Portage la Prairie and Headling where thousands of acres of valuable agricultural land have been repeatedly inundated. All the studies undertaken are in conjunction with the Red River Basin investigation currently being carried out.

Several alternative plans are being investigated to divert excess water from the Assiniboine River during flood stages. Detailed study is being given to water runoff data in the Assiniboine River Drainage Basin and the possibilities of building water-storage works on the headwaters of the Assiniboine River.

Lillooet Valley Reclamation Project.—The Lillooet Valley Reclamation project has been undertaken upon agreement between the Government of Canada, the Government of British Columbia and the Pemberton Valley Reclamation District. This project is located in the Lillooet River Valley above and below the town of Pemberton and its objective is to protect lands now under cultivation from flooding and to reclaim additional lands by dyking and drainage. The land to be reclaimed will ultimately amount to 14,000 acres, which will allow farmers in the district to increase their holdings and also permit the settlement of hundreds of additional inhabitants.

Construction work to deepen and straighten the channel leading from Lillooet Lake to Green Lake, below the town of Pemberton, was completed during the 1949 construction season. The construction of dykes and drains to reclaim the flooded areas along Miller Creek to Ryan Creek and Green River to Miller Creek has been almost completed. No damage from flooding occurred in the protected areas during 1951-52.

Land Utilization

In addition to cultural and water-conservation activities, the rehabilitation of drought areas involves the conversion of large tracts of land proved to be unsuitable for crop production, which had initially been cultivated to a permanent grass cover for live-stock production, and the relocation of farmers residing thereon. To this end the P.F.R.A.'s Land Utilization Program has constructed 57 operating pasture units, resulting in the reclamation of 1,590,200 acres of submarginal land. During the 1951-52 construction season, 149.5 miles of pasture fence were built which enclosed 69,120 acres in sections of three new pastures under construction and included extensions to eight established pastures. The three new pastures under construction are the Royal Pasture near Shellbrook, Sask., the Mantario Pasture near Alsask, Sask., and the Antelope Pasture near Laverna, Sask. Although these pastures were not completed entirely, the demand of local residents persuaded P.F.R.A. to begin pasture operations in 1952.

During the year ended Mar. 31, 1952, summer grazing was provided for over 70,000 head of live stock owned by between 5,500 and 6,000 patrons living on lands adjacent to these pastures.

An extensive pasture improvement program is in effect on all pastures and is immediately initiated as soon as new areas are enclosed. This policy has more than doubled the 1938 average carrying capacity on pasture land. The three improvement policies most extensively practiced in all pastures are: (1) regrassing—since 1938 approximately 160,000 acres of land in community pastures have been regrassed; (2) development of stock-watering sites—to Mar. 31, 1952, nearly 1,000 stock-watering dams, dugouts and wells have been constructed in community pastures for the purpose of facilitating the more efficient utilization of grass resources; and (3) pasture management and controlled grazing—with the application of scientific principles to the proper utilization of grass resources on pasture lands, P.F.R.A. has been able to greatly increase the beneficial use of grass resources.

PRAIRIE FARM ASSISTANCE ACT

The Prairie Farm Assistance Act, passed in 1939 and administered by the Federal Department of Agriculture, provides for direct money payments by the Federal Government, on an acreage basis, to farmers in areas of low crop yields in the Prairie Provinces and the Peace River District of British Columbia. The Act was designed to assist the municipalities and provinces, in years of crop failure, to meet relief expenditures which would normally be too great to be assumed by them. The Act provides that payments be made to farmers under certain conditions and terms and, in order that the Federal Government's costs may be defrayed to some extent, it is required that 1 p.c. of the purchase price of all grains (wheat, oats, barley and rye) marketed in the Prairie Provinces be paid to the Federal Government and set aside in a special fund for the purposes of the Act.

If the farmer, who may be an owner, a tenant, or a member of a co-operative farm association engaged in farming, is located in a crop-failure area, he may be awarded assistance on not more than one-half of the cultivated land or a maximum of 200 acres. The rates of payment range up to \$2.50 per acre.

From the inception of the scheme to Feb. 23, 1952, the total amount paid out under the Act was \$138,665,114. The amount collected under the 1 p.c. levy to Dec. 31, 1951, was \$58,455,486.

MARITIME MARSHLANDS REHABILITATION ACT

The marshlands of Prince Edward Island, Nova Scotia and New Brunswick are among the more productive soils in Canada when protected and properly cultivated. They are composed of deposits laid down by tidal waters and are, for the most part, adjacent to the Bay of Fundy.

The initial areas were reclaimed as early as 1630 and since that time about 80,000 acres have been protected by dykes and aboiteaux. These structures prevented flooding by tide water and permitted cultivation after drainage had been carried out. The original structures were made by hand labour and simple tools. Earth-moving equipment was not used until after 1940.

Through a variety of circumstances, i.e., loss of cattle markets, loss of hay markets and the increase in labour costs, maintenance of the protective structures was not adequately carried out and, in many cases, deterioration of the structures resulted. Because the marshlands, when protected, can play such an important role in the agricultural economy of the provinces concerned, the Government of Canada and the Provincial Governments of Nova Scotia and New Brunswick passed legislation permitting them to carry on a program of reclamation and rehabilitation of these lands. The federal Act, the Maritime Marshland Rehabilitation Act, was passed in 1948. Complementary provincial marshland reclamation Acts were passed by both Nova Scotia and New Brunswick in 1949. These Acts permitted agreements to be signed whereby the Government of Canada would construct or reconstruct the protective works, normally called dykes, aboiteaux and breakwaters, and also would assume the responsibility of maintaining these works until such time as they could be turned back to the provinces. The Federal Government is responsible also for any engineering work in connection with the complete program. The provinces are responsible for the organization of the marsh areas, the fresh-water drainage and acquisition of any land required. They are responsible also for the instigation and follow-up of a suitable land-use program.

In 1949 an administrative and operational group was established in the Maritimes by the Federal Department of Agriculture and the program of reclamation was initiated. Modern design and construction principles will be used for the building of protective structures, bearing in mind the basic principles of the older methods used. It is estimated that 70,000 or 80,000 acres, well drained and well farmed, will eventually be protected from the tide.

By Mar. 31, 1951, the provinces had asked to have 92 areas considered for reclamation purposes. These comprised 19,240 acres of marshland in New Brunswick, 22,570 acres in Nova Scotia and 250 acres in Prince Edward Island. It is estimated that the 42,060 acres of marshland in the three provinces constitute an integral part of 300,100 acres of farm land.

By the end of the 1950 construction season, protective works of a major type had been carried out on a total of 21 projects. In addition, 45 areas had received work on protective structures to some extent, placing them in a position to withstand the action of tidal waters until major reconstruction could be carried out.

Investigations to determine the advisability of constructing a large structure to eliminate the need for many miles of dyke and many aboiteaux were being carried out on the Annapolis River in Nova Scotia and on the Tantramar and Shepody Rivers in New Brunswick.

Considerable progress was made in the establishment of standard structures and standard methods of modern construction. New designs, based on up-to-date engineering knowledge and techniques, were under development with particular reference to soil mechanics.

Subsection 2.—Provincial Projects

Saskatchewan.*—Crown lands have been administered by the Lands Branch of the Saskatchewan Department of Agriculture since Apr. 1, 1947. A further development was the establishment of a Conservation and Development Branch on Apr. 1, 1949, which is responsible for the following: (1) development of irrigation; (2) reclamation of land by flood control and drainage; (3) the restoration of misused land and the development of under-utilized land; (4) the improvement of unoccupied land for agricultural settlement; (5) the construction of community pastures not provided for in the agreement with the Federal Government or outside the area served by the P.F.R.A. program.

The work of the Department in the field of agricultural rehabilitation and reclamation is based on the co-ordination of the federal P.F.R.A. program and the Provincial Department of Agriculture conservation and development activity. A closely knit working arrangement is fostered with respect to the development of federal and provincial projects.

The following is a summary of the activities of the Saskatchewan Department of Agriculture in accordance with the division of responsibility set out above.

There were 16 dry-land feed and fodder projects under development on Dec. 31, 1951. These projects were located on lands that have been under-utilized or that have been settled but abandoned because they were not suitable for arable agriculture. The area within the boundaries of the projects totalled 43,990 acres with 16,590 acres seeded to forage and 5,965 acres in preparation for seeding.

Five irrigated fodder projects located in or close to winter feed-deficient areas are under development; these include 5,800 acres of which 5,475 acres had, to Dec. 31, 1951, been prepared for irrigation, seeded or were in the process of being seeded to forage crops.

The Department has also assisted seven co-operative associations and rural municipalities in developing fodder-reserve projects. These projects include 4,160 acres of which 1,000 acres have been seeded to forage crops and 1,050 acres are in preparation for seeding.

Since Apr. 1, 1949, the installation of secondary distribution systems on irrigation projects for which storage and main canals had been constructed by P.F.R.A. brought an additional 17,668 acres in Saskatchewan under "the ditch". During the same period, 26 water-users districts were established with 684 farmer members.

The activity in the developing and promoting of community pastures outside the scope of the P.F.R.A. program resulted in the construction and improvement of 29 pastures comprising 354,000 acres. These pastures are operated as community pastures by the Lands Branch of the Department or by the municipality in which they are located, or by co-operative community pasture associations.

During 1951 provincial community pastures provided grazing for 7,133 head of live stock owned by 407 vicinity farmers.

* Prepared under the direction of W. H. Horner, Deputy Minister, Department of Agriculture, Regina, Sask.

The reclamation of lands by flood control and drainage is proceeding in 14 separate areas in the Province. Emphasis is being placed on the northeastern area bordering the presently settled northeastern portion of the Province. Lands benefited by drainage works constructed to date total 46,900 acres. Surveys for drainage and flood control works that will benefit 160,500 acres have been completed. Minor channel improvement works to secure more adequate drainage have been constructed in three sub-drainage areas in the southeastern portion of the Province.

Miscellaneous projects undertaken include the re-grassing of 14,700 acres and the planting of about 300,000 trees. Assistance is available to municipalities and local organizations for tree planting either by way of loan of departmentally owned machinery or financially for the purchase of machinery.

In areas of northern Saskatchewan concentrated groups of farmers outside the P.F.R.A. area have been assisted in the construction of dugouts and dams in developing stock-watering facilities.

Six conservation and development areas comprising a total of 1,316,340 acres have been established.

Activity during 1950 and 1951 in the improvement of unoccupied land for agricultural settlement included the designing of five new settlement projects containing 262 farm units. Under supervision of the Lands Branch, contracts were let for the clearing and breaking of 50 acres on each farm. Each of these farms will be under a 33-year lease that provides for specific conservation measures by Apr. 1, 1952.

Alberta.*—Extensive surveys have been carried out from time to time in Alberta to determine the distribution and extent of the available water supplies in the Province and their most beneficial use for irrigation, water power and other purposes. Sect. 69 of the Alberta Water Resources Act gives the Minister of the Department of Water Resources wide powers with respect to investigation of the water resources of the Province.

Much of the work done in more recent years has been carried out by the Federal Government in co-operation with the Provincial Government. Stream measurement is now done by the Hydrometric Service of the Federal Department of Resources and Development, while irrigation surveys are carried out largely by the Water Development Organization under P.F.R.A. The Water Resources Division, Federal Department of Resources and Development, and the power companies operating in the Province also assist in the program.

The Calgary Power Company has recently completed a fairly extensive and detailed water-power survey of the Bow River and its tributaries and, as a result, the Company has constructed a number of water-power reservoirs and power stations on the stream.

By Order in Council, dated Feb. 17, 1941, the St. Mary and Milk River Water Development Committee was set up to investigate and report on the many phases of irrigation development of southern Alberta including water supplies available to Canada from the Waterton, Belly, St. Mary and Milk Rivers; the most feasible plan to put these waters to their most beneficial use; the benefits which such water

* Prepared by J. L. Reid, Secretary, Alberta Power Commission, Edmonton, Alta. More detailed information regarding early basic surveys and the development of irrigation projects is given at pp. 375-377 of the 1951 Year Book.

development projects would confer on federal and provincial interests; the allocation of costs; and methods which might be adopted to finance such developments. The Committee completed a very thorough investigation and published a full and comprehensive report, not only on the projects on the international streams, but also on other projects in Alberta.

The following is a list of projects in operation in Alberta, together with irrigable areas and construction costs. Certain of these developments have been brought to fruition as joint efforts by the Province of Alberta and the federal authorities under P.F.R.A.

<u>Project</u>	<u>Irrigable Area</u>	<u>Construction Cost</u>

¹ See Bow River Project, pp. 395-396.

² Stockwater.

³ Approximate.

The following paragraphs outline developments during 1951-52.

St. Mary River Project.—The construction of the St. Mary and Milk Rivers development will make possible the addition of 390,000 acres to the irrigable area. This, together with the area now under irrigation under the old Alberta Railway and Irrigation Company's irrigation project (some 120,000 acres), will raise the total for the project to approximately 510,000 acres.

During 1951, the Water Resources Office spent about \$2,500,000 on the St. Mary River development for the construction of canals, purchase of material, acquiring right of way and colonization. The completion of the St. Mary River dam in 1951 is an outstanding contribution to irrigation development in Alberta.

Expenditures on the development in 1949-50 amounted to \$94,107 and in 1950-51 to \$1,673,563.

Bow River Project.—During 1951, P.F.R.A. commenced work on the enlargement of the main canals in order to provide for the extension of the project and for the irrigation of an additional 102,000 acres of prairie land. The total irrigable area of this project will be about 240,000 acres.

Work on the proposed P.F.R.A. earth dam on the Little Bow River is expected to start in 1952 and active participation by the Water Resources Office is expected to commence in 1953.

William Pearce Irrigation Project.—Topographical and soil surveys were continued during 1951 on this project and soil, climatic and engineering reports were made. Because of the excessive cost of constructing two separate projects, one in Saskatchewan and another in Alberta, a combined Alberta-Saskatchewan development has been proposed and investigated to some extent. However, a Royal Commission has recently been appointed by the Federal Government to advise regarding the Saskatchewan project and it is probable that a combined development will be investigated by the Commission.

Macleod Irrigation District.—During 1951, the Water Resources Office extended further assistance to the Macleod Irrigation District by improving laterals. P.F.R.A. is investigating ways and means of augmenting the water supply which is insufficient for the project. Expenditures by the Province on this project were: 1948-49, \$7,783; 1949-50, \$10,127; 1950-51, \$10,349; and 1951-52, \$13,603.

Ross Creek Irrigation District.—The construction phase of this project was completed in 1951 and is now considered ready for operation. Classification of the irrigable area has commenced and it is estimated that the area classified as irrigable will amount to 2,400 acres.

P.F.R.A. installed a proper headgate and improved the spillway of its diversion structure on Gros Ventre Creek thus ensuring proper operation of the main canal. Expenditures by the Province on this project were: 1950-51, \$52,964, and 1951-52, \$46,469.

Heart River Diversion Project.—This multiple-purpose project was brought to virtual completion in 1951. The concrete spillway at the dam was completed and two 6' x 6' steel headgates installed. During the spring runoff the reservoir on the Heart River filled up rapidly and overflowed into Winagami Lake through the north diversion canal, completely filling the lake, and the overflow in the south channel reached sizeable dimensions. In 1951 a combined control structure and roadway was built in the inlet to the south channel thus permitting control of the level of Winagami Lake. The project held back over 200,000 acre-feet of water during the 1951 runoff. Purchase of flooded areas around Winagami Lake was under way.

An aerial survey resulted in the production of an accurate topographic map from the southeast corner of Winagami Lake over to the Heart River. It has been established that a two-mile canal can readily be built to exploit the storage of the lake for power development. The power head involved is 70 ft. and the canal would be designed to carry 200 c.f.s. Economic aspects of this project are under investigation.

The town of McLennan is desirous of bringing water for domestic use from Winagami Lake by canal to Kimiwan Lake.

West Prairie River Control.—To protect the town of High Prairie and the road leading north from that town, the Water Resources Office has built a new bed for the West Prairie River with dykes on each side for a distance of about 1,500 ft., around a portion of the old bed that had become blocked with logs and silt.

A study is being made of the flooding in the area north and east of High Prairie, where a problem is created by logs and silt brought down from the Swan Hills.

Michichi Creek Diversion.—In 1951 the Department of Public Works started the construction of a new channel for Michichi Creek in North Drumheller to prevent flooding. The project will be completed in 1952.

Ground Water.—An inventory of ground-water supplies was undertaken in 1951 with the co-operation of the Federal Department of Agriculture which reported artesian or semi-artesian wells. Much valuable data has been obtained from the oil exploration companies on the results of striking water in their shot holes.

Highwood River Protection.—Further dredging was required at High River to keep the full force of the river away from the south bank and more work will be required in 1952 to ensure that the river will not jump over into the Little Bow River. High water conditions in 1951 did not improve the situation at High River and further work is essential.

Peace River Dugout Program.—Since the inception of this program, 1,900 dugouts have been constructed, the Department of Agriculture contributing five cents per cubic yard to a maximum of \$100. The average assistance given has been about \$90 per dugout and the average cost of earth work 20 cents per cubic yard. On this basis the actual cost value of dugouts constructed was approximately \$684,000.

British Columbia.*—About 17 p.c. of the arable land in British Columbia is under cultivation and nearly all the grazing area is being utilized. The 1,100,000 acres developed give a ratio of approximately one acre per person. Within this arable area there exists 150,000 acres of irrigated land which is considered to be less than one-half the ultimate land that can be served by water (approximately 350,000 acres).

About two-thirds of the irrigated area is made up of individual projects while the remaining 50,000 acres cover the larger irrigation projects listed below.

* Prepared by E. H. Tredcroft, Comptroller of Water Rights, Department of Lands and Forests, Victoria, B.C.

Section 4.—Statistics of Agriculture*

The collection, compilation and publication of statistics relating to agriculture is a responsibility of the Dominion Bureau of Statistics. Valuable information is obtained through the Decennial Census of Canada and each Census of the Prairie Provinces. Very few of the results from the 1951 Census were available when this Chapter of the Year Book was prepared but have been incorporated wherever possible. Detailed agricultural census statistics are published in bulletin form and may be secured from the Dominion Statistician, Ottawa.

The Bureau also collects and publishes primary and secondary statistics of agriculture on an annual and monthly basis. The primary statistics relate mainly to the reporting of crop conditions, crop and live-stock estimates, values of farm lands, wages of farm labour and prices received by farmers for their products. The secondary statistics relate to the marketing of grain and live stock, dairying, milling and sugar industries and cold-storage holdings.

* Revised in the Agriculture Division, Dominion Bureau of Statistics.

In the collection of annual and monthly statistics, the Federal Department of Agriculture and the Provincial Departments of Agriculture, as well as such agencies as the Board of Grain Commissioners and the Canadian Wheat Board, co-operate with the Bureau. Many thousands of farmers throughout Canada also voluntarily send in reports.

The figures for 1949 to 1951 (except for 1951 Census data) contained in this Section do not include those for Newfoundland, though that Province came into Confederation on Mar. 31, 1949. Agriculture plays a relatively minor part in Newfoundland's economy. The climate is not well suited to the production of any but the hardier crops and the amount of pasture land and arable soil is limited.

Subsection 1.—Farm Income and Capital

Farm Cash Income.—Estimates of farm cash income are based on reports of marketings and prices received by farmers for principal farm products and are subject to revision. The estimates include the amounts paid on account of wheat participation certificates, oats, barley and flax adjusting and equalization payments and those Federal and Provincial Government payments that farmers receive as subsidies to prices. It is estimated that, during 1950, Canadian farmers (excluding Newfoundland) received \$2,219,600,000 from the sale of farm products and from grain equalization and participation payments on previous years' crops. This estimate is 10.7 p.c. below the record high figure of \$2,486,600,000 for 1949. In addition to the above receipts, supplementary payments made under the provisions of the Prairie Farm Assistance Act amounting to \$13,800,000 were paid to farmers in the drought-stricken areas of the Prairie Provinces. This figure compares with \$20,700,000 and \$17,600,000 paid during 1948 and 1949, respectively.

The decline in the 1950 farm cash income was largely attributable to a drop in the cash receipts from the sale of grains and substantially smaller grain equalization and adjustment payments to prairie farmers. The latter amounted to nearly \$50,000,000 compared with approximately \$220,000,000 in 1949. A lowering of the initial price to producers and a poor-quality crop combined to offset increased marketings during 1950 and give a cash income from the sale of wheat of \$379,100,000, almost 20 p.c. below the returns realized in 1949. Commencing Aug. 1, 1950, the initial price to producers of No. 1 Northern wheat, in store at the Lakehead, was lowered from \$1.75 to \$1.40 per bu. Severe frosts in the Prairie Provinces during August caused considerable damage to the crop and sharply reduced the average grade.

Receipts from the sale of coarse grains during 1950 were also below the 1949 level, partly because of smaller marketings and lower-quality crops. From Aug. 1, 1949, coarse grains came under the terms of the government compulsory marketing scheme whereby farmers received initial prices only at time of delivery. These prices were based on 60 cents per bu. for No. 1 Feed oats and 87 cents per bu. for No. 1 Feed barley, in store Fort William-Port Arthur, and were lower than the free market prices prevailing during the first seven months of 1949. However, in addition to

these initial prices, farmers also received producer participation certificates which entitled them to share, at a later date, any surpluses accumulated by the Canadian Wheat Board through the sale of these grains. During the last quarter of 1950 about \$42,000,000 was distributed in the form of participation payments for the 1949 crop of oats and barley.

An increase in total live-stock returns from \$829,000,000 in 1949 to \$895,600,000 in 1950 was largely due to higher average prices for all live stock except hogs, since marketings were slightly lower. Higher prices for cattle reflected a continuing strong demand in the United States for Canadian beef. Declines in marketings of cattle and calves and of sheep and lambs in 1950 were more than compensated for by the higher prices. On the other hand, a United Kingdom-Canada bacon contract at prices below those received in 1949 resulted in lower average hog prices for 1950 and the income from this source amounted to \$317,500,000 compared with \$327,900,000 in 1949. Income from the sale of dairy products, estimated at \$330,100,000, was 6.2 p.c. below the 1949 total of \$352,000,000. Reduced income from the sale of eggs in 1950 resulted from a combination of smaller marketings and lower prices.

7.—Cash Income from the Sale of Farm Products, by Sources, 1949 and 1950

(Exclusive of Newfoundland)

Farm Net Income.—Preliminary estimates indicate that farmers' net income from farming operations in 1950 amounted to \$1,451,700,000, almost 12 p.c. less than the 1949 total of \$1,640,500,000 and about 14 p.c. less than the record high of \$1,681,600,000 realized in 1948. This decline came as a result of a substantially lower cash income, a smaller value of income in kind and a continued increase in farm operating expenses and depreciation charges. Compared with 1949, cash income from the sale of farm products at \$2,219,600,000 was down nearly 11 p.c., while income in kind at \$383,500,000 declined about 1 p.c. Farm operating expenses and depreciation charges totalling \$1,296,000,000 were almost 11 p.c. higher than in 1949. Increases in the year-end, farm-held stocks of grain in 1950 more than offset a decline in year-end live-stock numbers to give an over-all inventory increase for the first time since 1943.

Value of Farm Capital.—The items included in the term "farm capital" as used in Table 11 are: lands and buildings; implements and machinery, including motor-trucks and automobiles; and live stock, including poultry and animals on fur farms. The value of lands and buildings for intercensal years is based on the value of occupied farm lands reported annually by crop correspondents; annual values of farm implements and machinery are estimated on the basis of sales reported each year.

Value of Farm Lands.—The average value of occupied farm land in Canada for 1950 was reported at \$43 per acre. This was an increase of 7.5 p.c. over the 1949 average value but an advance of 79.2 p.c. over the 1935-39 level. The all-Canada average is determined by weighting the provincial averages by the area of occupied farm land in each province according to the latest census figures available. The upward trend in farm land values from pre-war levels reflects, at least in part, the relative changes in the price levels of farm products and of the things that farmers buy. The Bureau's index of farm prices of agricultural products for 1950 was 160.8 p.c. above the 1935-39 level, while for the same year the index of prices of commodities and services used by farmers, including living costs, advanced 95 p.c. over the 1935-39 base-period level.

12.—Average Values per Acre of Occupied Farm Lands, Selected Years, 1910-50

NOTE.—Figures include unimproved lands and buildings.

Subsection 2.—Volume of Agricultural Production

The index of physical volume of agricultural production, based on the period 1935-39, inclusive, represents a measure of "net farm production". This is achieved by removing duplication, e.g., when feed grains credited to field-crop production also appear in the various forms of live stock and live-stock products.

The high point of the index, 164.2, was reached in 1942; in 1950 it stood at 139.8.

13.—Index Numbers of Physical Volume of Agricultural Production, by Provinces, 1941-50

(1935-39=100. Exclusive of Newfoundland)

NOTE.—For a description of this index, methods and coverage, see D.B.S. *Quarterly Bulletin of Agricultural Statistics* for July-September, 1949. Figures for 1935-40 are given at p. 420 of the 1950 Year Book.

Subsection 3.—Field Crops

The total area of principal field crops in 1950 was estimated at 62,297,000 acres, up slightly from 1949 and about 7 p.c. above the pre-war (1935-39) level. Production of the major grains in 1950 was well above that in 1949 but severe frost damage to western crops in the autumn of 1950 resulted in the marketing of large volumes of low-quality grain. Of the 1950 wheat crop only an estimated 34 p.c. graded No. 3 Northern or better, in contrast to approximately 85 p.c. of the 1949 crop qualifying for the same grades.

The gross value of production of principal field crops produced on Canadian farms in 1950, based on average prices received by farmers throughout the 1950-51 crop year, was estimated at a record \$1,854,463,000.

Acreage data for 1951 field crops are not published in the accompanying tables but may be found in the current publications of the 1951 Agricultural Census. Necessary revisions of intercensal data in Tables 14 to 17 are being prepared.

Stocks of Grain in Canada.—Table 18 shows the stocks of Canadian grain on hand on July 31 for the years 1945-51, with averages for the five-year period 1935-39 and 1940-44, in both Canada and the United States, also the amounts held on farms in Canada. Farm stocks are given for Canada and the Prairie Provinces separately, while an additional column indicates the amounts held in country elevators in the Prairie Provinces.

18.—Carryover of Canadian Grain as at July 31, 1945-51, with Five-Year Averages, 1935-39 and 1940-44

NOTE.—Figures for individual years prior to 1945 will be found in corresponding tables of previous editions of the Year Book.

Subsection 4.—Live Stock

The numbers of live stock on farms in the different provinces, as reported at the 1941 and 1951 Censuses, are given in Table 19 and the average value per head of farm live stock is given by provinces in Table 20. The annual estimates for intercensal years, as shown in Tables 19 and 20 of the 1951 Year Book, will be revised on the basis of the 1951 Census figures and will be published in the D.B.S. *Quarterly Bulletin of Agricultural Statistics*.

19.—Live Stock on Farms, by Provinces, at June 1, 1941 and 1951

¹ Cows and heifers, two years or over, kept for milk purposes.

The Federal Department of Agriculture inspects all live stock in plants designated as inspected establishments under the Meat and Canned Goods Act. A statistical record is kept of these inspections and the figures appear in Table 21. Local wholesale butchering and such slaughtering as are carried out by retail butchers and by farmers for their own use are not included. Actually, the slaughtering and meat-packing industry is concentrated into a comparatively small number of large establishments to facilitate greater efficiency and utilization of products. Thus, the figures of Table 21 are fairly inclusive. The slaughtering and meat-packing industry is dealt with in its proper relation to all other manufacturing enterprises in Chapter XVI. On a gross value basis it normally ranks among the three largest manufacturing industries in Canada but it owes its importance to the value of raw products obtained from the farmer and the rancher rather than to the value added by the manufacturing process.

Wool.—Wool production in Canada (exclusive of Newfoundland) in 1951 was 9.2 p.c. below that in 1950 and was only 44.1 p.c. of the 1945 peak crop. The 1935-39 average was 16,022,000 lb. and the 1951 production only 8,653,000 lb. The shorn-wool production in 1951 was lower, the result of a decrease in sheep population. Average fleece weight was 7.5 lb. compared with 7.7 lb. in 1950. The 27.4 p.c. reduction in wool pulled from domestic skins was partly accounted for by a decrease in inspected slaughterings of sheep and lambs; an increase in the special processing of skins may also have been a contributing factor.

Exports of wool in 1951 were down by nearly 1,700,000 lb. and imports by over 13,200,000 lb. as compared with 1950. Thus, assuming there was no change in stocks, the domestic disappearance of wool was lower by 14.2 p.c. in 1951 than in 1950.

22.—Estimated Production, Exports, Imports and Apparent Consumption of Wool, 1942-51

NOTE.—All estimates are on a 'greasy' basis. Comparable statistics of production for the years 1920-29 are given at p. 219 of the 1939 Year Book, for 1930-36 at p. 214 of the 1945 edition and for 1937-41 at p. 368 of the 1948-49 edition.

Subsection 5.—Dairying

Milk Production.—Milk production in 1951 amounted to 16,391,998,000 lb. a considerable reduction from the high point of 17,628,610,000 lb. reached in 1945. During the five-year period, 1946-51, the milk-utilization pattern changed somewhat. In the later year less milk was used for butter (creamery and dairy) and for the manufacture of cheese. On the other hand, more milk was sold in fluid form and more was used for the production of concentrated milk products and ice cream. The proportion of total milk production used for factory-produced dairy products decreased from 52.3 p.c. in 1946 to 51.1 p.c. in 1951 and the proportion sold in fluid form increased from 25.1 p.c. to 25.8 p.c. Milk used for all purposes on farms (farm-home consumed, manufactured and fed) increased from 22.6 p.c. of the total in 1946 to 23.1 p.c. in 1951.

23.—Production and Utilization of Milk, by Provinces, 1948-51, with Totals for 1944-51

NOTE.—Figures for years prior to 1948 will be found in the corresponding tables of previous editions of the Year Book. Figures for 1949 have been revised since the publication of the 1951 Year Book; those for 1951 are subject to revision.

¹ Includes values of skim milk, buttermilk and whey retained on farms.

Butter and Cheese Production.—Total butter production in 1951 amounted to 305,964,000 lb., of which 257,604,000 lb. was creamery butter, 46,400,000 lb. dairy or farm-made butter and 1,960,000 whey butter. This output may be compared with the peak production of 371,000,000 lb. reached in 1941 which was made up of 286,000,000 lb. of creamery butter, 83,000,000 lb. of dairy butter and about

2,000,000 lb. of whey butter. The decline from the 1941 total was not continuous in the intervening years. The total for 1943 was 2,000,000 lb. lower than that for 1941, followed by declines for the next two years to 328,194,000 lb. in 1946, increases for two years to 350,317,000 lb. in 1948 and then decreases again to 1951, the lowest production since 1930. The loss in butter production, however, was more than covered by margarine output which amounted to 105,151,000 lb. in 1951.

Factory cheese production in 1951 was estimated at 90,615,000 lb. a decrease of 12,044,000 lb. or 11.7 p.c. from the 1950 estimate and a 56.3 p.c. decline from the peak production of 117,000,000 lb. reached in 1942. Total cheese production, including factory and farm-made cheese, amounted to 208,218,000 lb. in 1942. The total manufactured in 1951, on the other hand, was the lowest on record. Indeed, judging from early estimates of farm-made cheese production and cheese exports, it is apparent that the 1951 output was the lowest since the mid-1880's. After the peak output was recorded in 1942, production fell to 167,218,000 lb. in 1943 and rose again to 189,000,000 lb. in 1945. However, from 1945 to 1948 factory output was cut approximately in half as a result of the restrictions placed on the importation of cheese into the United Kingdom. Lower creamery butterfat prices in 1949 and the uncertainties resulting from the introduction of margarine in that year induced farmers to sell more of their milk to the cheese factories, but this recovery proved temporary and in the two succeeding years a decline of about 30,000,000 lb. occurred.

25.—Production of Butter and Cheese, by Provinces, 1948-51, with Totals for 1944-51

NOTE.—Figures for years prior to 1948 will be found in corresponding tables of previous editions of the Year Book. Figures for 1949 have been revised since the publication of the 1951 Year Book; those for 1951 are subject to revision.

¹ Factory-made cheese includes cheddar and other cheese made from whole milk. The latter amounted to 4,923,000 lb. in 1948, 4,115,000 lb. in 1949, 5,005,000 lb. in 1950 and 5,355,000 lb. in 1951, produced principally in Quebec and Ontario.

Production of Concentrated Milk Products.—Products manufactured in concentrated milk plants and creameries equipped with powder manufacturing facilities are classified as whole-milk products and milk by-products. Production of whole-milk products in 1951 increased 16 p.c. over 1950 production while concentrated milk by-products increased by 5 p.c.

Domestic Disappearance of Dairy Products.—The estimated consumption of fluid milk and cream, on a milk basis, amounted to 4,450,000,000 pt. in 1951, 10,000,000 pt. higher than the 1950 consumption and 596,000,000 pt. above that of 1942. The average daily consumption per capita was 0.89 pt. in 1951 compared with 0.91 pt., in 1950. The peak daily per capita consumption of 1.01 pt. was reached in 1945 and 1946 when subsidies were in effect.

Domestic disappearance of butter (creamery, dairy and whey) was approximately 317,251,000 lb. in 1951, compared with 325,755,000 lb. in 1950 and 336,671,000 lb. in 1943. Per capita figures for these years were 23.25 lb., 24.38 lb. and 23.25 lb., respectively. The per capita consumption of margarine for 1951 and 1950 was 7.44 lb. and 6.76 lb., respectively.

Total cheese consumption was about 65,561,000 lb. in 1951, an average of 4.80 lb. per capita. There was little change from the per capita consumption of the previous year.

The domestic disappearance of concentrated whole-milk products increased from 19.77 lb. per capita in 1950 to 20.58 lb. in 1951, and milk by-products from 6.05 lb. to 6.56 lb. in the same comparison.

Disappearance of all dairy products represented the equivalent of approximately 1,080 lb. of milk per capita in 1951 compared with 1,129 lb. in 1950.

¹ Includes malted milk, cream powder and substandard products of a variable fat content, items that do not appear separately in this table.

² Includes milk by-products items not separately listed i.e., condensed buttermilk, powdered buttermilk, sugar of milk, casein and powdered whey in 1948-49.

³ Includes ice cream and cottage cheese in terms of milk.

Subsection 6.—Poultry and Eggs

The numbers of poultry on farms as reported at the Censuses of 1941 and 1951 are given in Table 30. Estimates for individual years between these censuses are being revised on the basis of 1951 Census data. At the time of preparation of this Chapter, 1951 Census figures were not available on production, utilization and values of farm eggs, and on domestic disappearance of poultry and eggs. Estimates shown in Tables 31 and 32 are subject to revision on the basis of the 1951 Census.

Egg production in 1951 decreased slightly, the effects of fewer birds being offset to some extent by higher production per hen. The price of eggs averaged 50.9 cents per doz. in 1951, about 13 cents higher than in 1949. The per capita disappearance amounted to 23.1 doz. in 1951 compared with 22.0 doz. in 1950.

Farm production of poultry meat in 1951 was 2.7 p.c. above production in 1950.

Subsection 7.—Fruit

Commercial fruit growing in Canada is confined almost exclusively to rather limited areas in the Provinces of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia. In Nova Scotia production is centred mainly in the Annapolis Valley and in New Brunswick it is centred in the St. John River Valley and Westmorland County. The fruit-growing districts of Quebec are the Montreal area, the North Shore area, the Eastern Townships and Quebec City district. In Ontario, fruit is grown in all the counties adjacent to the St. Lawrence River and the Great Lakes as far west as Georgian Bay, the Niagara district being the most productive. In British Columbia, the four well-defined fruit areas are the Okanagan Valley, the Fraser Valley, the Kootenay and Arrow Lakes district and Vancouver Island. The climate elsewhere in Canada is not suitable for commercial tree-fruit culture.

A marketing system has been developed for distributing fresh fruit from the specialized production areas to all parts of the country and a very large proportion of the deciduous fruit consumed in Canada is domestically grown. Considerable quantities of apples, strawberries and blueberries are exported annually. The United States is the most important export market for Canadian fruit, although substantial shipments of apples are ordinarily made to the United Kingdom and to other overseas countries. In most of the producing areas, and particularly in the Annapolis Valley of Nova Scotia, the Niagara Peninsula of Ontario and the Okanagan Valley of British Columbia, fruit-growing is the principal form of agriculture and its prosperity is of paramount importance to the economy of these areas. Apples and small fruits are produced commercially in the four provinces named, but tender tree fruits and commercial vineyards are limited to Ontario and British Columbia.

Canning and processing industries have developed in the fruit-growing districts and, although the importance of the processing market varies with different fruits, it provides a valuable outlet for substantial proportions of most Canadian-grown fruit crops. Some canned fruits are exported.

Subsection 8.—Special Crops

Tobacco.—The chief tobacco-growing area is located in southern Ontario in the counties adjacent to Lake Erie. Most of the cigarette tobacco comes from this district. In 1950, 87,330 acres of flue-cured or Bright Virginia type tobacco and 4,652 acres of Burley tobacco were harvested. These are the most important types grown, though dark air-cured and fire-cured tobacco as well as cigar tobacco are grown on a more limited scale. The only other important production comes from Quebec. In 1950, 4,630 acres of flue-cured tobacco, 3,212 acres of cigar tobacco and 1,321 acres of pipe tobacco were harvested in that Province.

A study of Department of National Revenue reports of tax-paid withdrawals of tobacco products reveals changes in the smoking habits of Canadians during the past three decades. In 1922, the first year for which comparable figures are available, the Canadian per capita consumption of cigarettes was 229, cigars 20, cut tobacco 1.26 lb., plug tobacco 1.14 lb. and snuff about 1.25 oz. By 1951, the annual per capita consumption of cigarettes had increased to 1,118, cigars had dropped to 12.1, cut tobacco went up to 1.95 lb. and plug declined considerably.

Sugar Beets and Beetroot Sugar.—In 1950 the Canadian sugar-beet crop exceeded 1,000,000 tons for the first time. Sugar beets are grown commercially in Quebec, Ontario, Manitoba and Alberta, and seven beet-sugar factories are located in these Provinces. In Quebec, commercial production, which centres in the St. Hilaire area of the Eastern Townships, started in 1944. In 1950, about 147,000 tons were harvested from 12,000 acres. The sugar-beet industry of Ontario is largely confined to the southwestern section of the Province and factories are located at Wallaceburg and Chatham. The wartime reduction in acreage, caused by labour shortage and competition from other crops, has been overcome and in 1950 Ontario factories processed about 386,000 tons harvested from over 34,000 acres.

Processing of sugar beets in Manitoba began in 1940 when 95,000 tons were handled. In 1950 the factory processed 150,000 tons from 20,000 harvested acres. In Alberta, where the industry has shown steady growth, sugar beets are produced under irrigation with yields averaging above those received in the other provinces. In 1950 the three Alberta factories, located in the south of the Province at Raymond, Picture Butte and Taber, handled 445,000 tons of beets from a harvested area of over 36,000 acres. Twenty-five years earlier the Alberta crop amounted to only 41,000 tons from about 5,000 acres.

Apiculture.—Honey is produced commercially in all provinces of Canada, Ontario being the largest producer. There is a considerable movement of honey particularly from the Prairie Provinces to other parts of Canada and to other countries, although the export trade in this commodity has been sharply reduced in recent years due to strong competition and to import restrictions imposed by many countries.

The 1951 crop was the largest since 1948, in spite of a reduction in the number of bee colonies. The higher-than-average 1951 yield was the result of unusually favourable weather conditions during the summer, particularly in Ontario.

In order to facilitate storage, shipment and uniformity of quality, considerable quantities of Canadian honey are pasteurized. Beekeepers' marketing co-operatives are active in several provinces.

As a matter of interest it is noted that bees are kept in some of the fruit-growing and greenhouse districts of the country chiefly for purposes of pollination.

Maple Sugar and Syrup.—Maple syrup is produced in the Provinces of Nova Scotia, New Brunswick, Quebec and Ontario. The bulk of the crop comes from the Eastern Townships of Quebec which is famous both in Canada and the United States as the centre of the maple-products industry. Virtually all of the maple products exported are sent to the United States with the larger proportion moving as sugar, although substantial quantities of syrup are also shipped. In 1950-51, 11,300,000 lb. of maple products were exported, representing about 54 p.c. of the total crop. This was the largest volume of maple products to be exported in recent years.

Most of the syrup sold in Canada is marketed in one-gallon cans direct to the consumer from the producer but a considerable amount of both sugar and syrup is sold each year to processing firms.

Fibre Flax.—The demand for fibre flax was heavy during the war years when exports increased to many times the pre-war volume. After World War II, however, exports of fibre flax to Canada's principal market, the United Kingdom, dropped sharply and acreage devoted to this crop decreased and in 1950 was at the lowest level since 1931. Flax is now grown commercially only in Ontario and Quebec.

42.—Acreages, Yields and Values of Flaxseed, Fibre and Tow, 1946-50, with Five-Year Averages, 1941-45

NOTE.—Figures for the years prior to 1946 will be found in the corresponding tables of previous editions of the Year Book.

Subsection 9.—Prices of Agricultural Produce

During 1951, the monthly index numbers of farm prices of agricultural produce were consistently and substantially higher than corresponding figures for 1950. Increasing live-stock prices were largely responsible for the almost uninterrupted

rise in the index from 273.9 in January to 307.2 in July. From this all-time high, the index declined steadily to 276.0 in December, a result mainly of smaller advance payments for grain delivered by western farmers after Aug. 1, 1951, and lowering prices for live stock, poultry and eggs. The annual average for the year at a record high of 287.2 was about 10 p.c. above the previous high of 260.5 reached in 1950.

43.—Average Index Numbers of Farm Prices of Agricultural Products, by Provinces, 1942-51, and by Months, 1950 and 1951

(1935-39=100)

NOTE.—A description of this index, its coverage and the methods used will be found in D.B.S. *Quarterly Bulletin of Agricultural Statistics* for October-December, 1946.

¹ Average cash closing price, Winnipeg Grain Exchange to Sept. 27, 1943. Thereafter, initial payments plus additional payments to producers. ² Based on cash closing prices, Winnipeg Grain Exchange.

From Aug. 1, 1944, to Oct. 22, 1947, prices of oats and barley remained at or near the government-imposed ceiling prices. From Oct. 23, 1947, to July 31, 1949, open market trading again prevailed. Equalization payments to producers are included for the crop years 1943-44 to 1947-48, inclusive.

³ Average cash payments to producers are included for the crop years 1943-44 to 1947-48, inclusive. ⁴ During March the Canadian closing price, Winnipeg Grain Exchange, except where otherwise noted. ⁵ Average cash payments to producers are included for the crop years 1943-44 to 1947-48, inclusive. ⁶ During March the Canadian closing price, Winnipeg Grain Exchange, except where otherwise noted. ⁷ Winnipeg Grain Exchange renewed trading in flaxseed cash and futures on Aug. 16, 1948. The Canadian Wheat Board was authorized to buy all flaxseed offered to it during the 1948-49 crop year on the basis of \$4 per bushel for No. 1 C.W. in store Fort William-Port Arthur.

45.—Yearly Average Prices per 100 lb. of Canadian Live Stock at Principal Markets, 1947-51

NOTE.—Classification of live stock was changed in February 1949 as follows: steers up to 1,050 lb. changed to steers up to 1,000 lb.; steers over 1,050 lb. to steers over 1,000 lb.; lambs, good handy weights to lambs, good; sheep, good handy weights to sheep, good.

Subsection 10.—Food Consumption

Consumption of Major Foods.—A study of consumption of the major foods was undertaken during World War II, by the Dominion Bureau of Statistics in recognition of the national and international significance of such information. While data on total consumption of certain commodities such as wheat, alcoholic beverages, meats, etc., have been available for a considerable period, it was found necessary to establish a per capita level of consumption of a wide range of products on a comparable basis.

The figures represent available supplies including production and imports, adjusted for change of stocks, exports, marketing losses and industrial uses. All calculations have been made at the retail stage of distribution, except meats for which the figures are worked out at the wholesale stage. The amounts of food actually eaten would be somewhat lower than indicated because of losses and waste occurring after the products reached the hands of the consumer. It should also be pointed out that there are minor discrepancies in certain of the figures since statistics of storage stocks in the hands of retailers and consumers were not available. However, the figures represent the best summary of food consumption data that has been compiled for Canada.

All basic foods have been classified under 13 main commodity groups. Totals for each group have been computed using common denominators for the group, as for example: milk solids (dry weight) in the case of the dairy-products group; fat content in the case of fats and oils; and fresh equivalent in the case of fruits. All foods have been included in their basic form, that is, as flour, fat, sugar, etc., rather than in more highly manufactured forms.

The series in Table 46 represents the official estimates of yearly supplies of food moving into consumption, expressed in pounds per capita, for the years 1935-39 as an average for comparison with the years 1949, 1950 and 1951.

**46.—Per Capita Supplies of Food Moving into Consumption, 1949, 1950 and 1951,

¹ Fluctuations in apparent per capita flour consumption are partly due to the fact that complete data on flour inventories in all positions are not available. ² Includes amounts dumped or fed to live stock for which no data are available. ³ Includes soybean flour. ⁴ Exclusive of Newfoundland. ⁵ Includes cream expressed as milk.

Consumption of Meats.—Production of meats from slaughter, total supply, distribution and per capita consumption of meats and lard are shown in Table 47. All estimates are on a carcass-weight basis except canned meats which are in terms of product.

¹ Edible meat excluding offal. ² Basis cold dressed carcass weight. ³ Includes edible offal of beef and veal. ⁴ Quantity small; included with beef. ⁵ Edible meat excluding fats and offal. ⁶ The positive changes represent deductions from the available supply during a given year and therefore are subtracted; similarly, negative changes represent an increase in disappearance. Includes rendered pork fat.

Section 5.—International Crop Statistics

Tables 48 and 49 are based on official estimates published in March 1952, by the Office of Foreign Agricultural Relations, United States Department of Agriculture, and give the acreages and production of wheat and the production of oats and barley for the harvests of 1950 and 1951, with averages for the years 1940-44, in the leading countries of the world.

		SPECIAL ARTICLE: The Pulp and Paper Industry in Canada	467

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Land is the basis of the Canadian economy and wise use of the land is the foundation of good forestry. Good forestry will aid in maintaining agricultural lands against drought and erosion; will continuously protect water catchment areas and assure supplies of water; will furnish good cover for game and fur-bearing animals; and will give Canadians and their tourist guests opportunities for recreation which only the forests can provide.

A Special Article dealing with Canada's forest economy appears in the Year Book 1951, pp. 425-437.

Section 1.—Forest Regions†

The forests of Canada cover a vast area in the north temperate climatic zone. Wide variations in physiographic, soil and climatic conditions cause marked differences in the character of the forests in different parts of the country, hence eight fairly well defined forest regions may be recognized. These are the Boreal, Great Lakes-St. Lawrence, Acadian, Deciduous, Subalpine, Columbia, Montane, and Coast Forest Regions, as illustrated on the accompanying map. The relative proportion of the total area of all forest regions occupied by each is as follows:—

Region	Percentage of Total Forested Area	Region	Percentage of Total Forested Area
Boreal.....	80.1	Acadian.....	2.0
Great Lakes-St. Lawrence....	7.9	Columbia.....	0.9
Subalpine.....	4.0	Deciduous.....	0.4
Montane.....	2.5		
Coast.....	2.2	TOTAL.....	100.0

* Sections of this Chapter that deal with forestry and forest administration have been revised in the Forest Economics Section, Forestry Branch, Department of Resources and Development. Sections dealing with forest utilization and forest industries, except as otherwise noted, have been revised in the Forestry Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

† A more detailed discussion of forest regions is given in the Department of Resources and Development, Forestry Branch, Bulletin No. 89, *A Forest Classification for Canada*, by W. E. D. Halliday. Also see Chapter I for accounts of variations in Canadian physiography, climate, etc.

The Boreal Forest Region.—This forest region, covering the greater part of Canada, stretches unbrokenly from eastern Newfoundland westward to the boundary of Alaska. Along its southern border, it follows the limits of the Great Lakes-St. Lawrence Region and then skirts the grasslands of the Prairies to the foothills of the Rocky Mountains and northwestward into Yukon Territory. The northern limits of tree growth form its boundary to the north. White and black spruce, trembling aspen, balsam, poplar, tamarack, white birch and jack pine comprise the principal trees of the Region.

Within the Region are two sections which are quite distinctive: the Northern Transition and the Aspen Grove Sections. The Northern Transition Section lies between the merchantable forests on the south and the arctic tundra on the north. White and black spruce, tamarack and white birch, stunted in growth, are the characteristic trees. The Aspen Grove Section, lying as a transition zone between the true forest region to the north and the open grasslands to the south, has trembling aspen as its dominant tree species. Bur oak, white elm and green ash are found in certain localities.

The Great Lakes-St. Lawrence Forest Region.—This Region lies south of the Boreal Forest in the eastern part of Canada. It is situated in southwestern Newfoundland and westward from the drainage basin of the Great Lakes-St. Lawrence River System to southeastern Manitoba. Some of the earliest centres of settlement are within the Region and in many portions the forest has been largely cleared and remains now only in woodlots and patches on poor soils. The area is characterized by the occurrence of white pine and yellow birch. A large number of species occur, including red pine, jack pine, white spruce, black spruce, balsam fir, cedar, hemlock, white birch, the maples and elms.

The Acadian Forest Region.—This Region includes Prince Edward Island, Nova Scotia, and all but the northwest corner of New Brunswick. Red spruce is the characteristically dominant conifer, and is usually associated with balsam fir, white and black spruce, hemlock, yellow birch and sugar-maple.

The Deciduous Forest Region.—The Deciduous Region of Canada consists of a small northerly portion of the temperate forest of the same type as in the United States. The Region occupies the Sarnia-Niagara peninsula of southern Ontario. Beech and sugar-maple, associated with basswood, red maple and several oaks are the characteristic trees. Many broad-leaved species such as hickory, black walnut, tulip-tree, cucumber-tree, mulberry, sycamore, sassafras, and a number of other species find their northern limit in this Region.

The Subalpine Forest Region.—This is essentially a coniferous forest region, occupying the upper slopes of the Cordilleran System east of the Coast ranges, and lying between the Alpine Tundra formation and the Montane Forest Region. Generally, the Region lies between altitudes of 3,000 and 6,000 feet. The dominant tree species are Englemann spruce, alpine fir, lodgepole pine and trembling aspen.

The Columbia Forest Region.—The forests of this Region, often referred to as the interior wet belt of British Columbia, comprise stands in the valleys of the Columbia and Fraser Rivers that lie between altitudes of 2,500 and 4,000 feet. These forests are somewhat similar in composition to those of the Coast Region

The principal tree species are Englemann spruce, western red cedar, western hemlock and Douglas fir. Associated with these are grand fir, western white pine and western larch. Black cottonwood is found on rich alluvial soils.

The Montane Forest Region.—This Region forms part of the interior dry belt of British Columbia and is found generally at elevations below the Columbia Region. It covers an extensive series of plateaux, valleys and ranges in the interior of the Province. Typical of the Region are ponderosa pine, Douglas fir, lodgepole pine and trembling aspen. Towards the northern half of the Region, ponderosa pine disappears, leaving Douglas fir and lodgepole pine as characteristic species.

The Coast Forest Region.—The western slopes of the Coast and Cascade Mountains and the islands along the coast comprise this Region. It produces the largest trees and heaviest stands in Canada. The dominant trees are western hemlock and western red cedar. Associated with these are Douglas fir in the south and Sitka spruce in the north. Also occurring in the Region are yellow cedar, western white pine and amabilis fir. Black cottonwood and red alder are the most important hardwood species in the Region.

Section 2.—Native Tree Species

There are more than 150 tree species in Canada, of which 31 are conifers, commonly called 'softwoods'. About two-thirds of these softwoods are of commercial importance. Of the large number of deciduous or 'hardwood' species, about 10 p.c. is of any great commercial value to the wood-using industry. About 77 p.c. of the volume of merchantable timber is made up of softwood species.

A short description of the individual tree species is given at pp. 384-387 of the 1947 Year Book. More detailed information on Canadian trees is given in Forestry Branch Bulletin No. 61, *Native Trees of Canada*,* published by the Department of Resources and Development.

Section 3.—Forest Resources

The forested area of Canada (exclusive of Labrador) is estimated at 1,299,759 sq. miles, or 36 p.c. of the total land area. In comparison, only 15 p.c. of the land area is considered to be of present or potential value for agriculture and 4 p.c. is classed as "improved and pasture".

Almost one-half of the total forested area of Canada is classified as "non-productive", i.e., incapable of producing crops of merchantable wood. However, these forests do provide valuable protection for drainage basins and shelter for game and fur-bearing animals.

Of the "productive" half of the forested area, 484,000 sq. miles are considered to be now accessible for commercial operations. For further details see Table 1, p. 19, in Chapter I. The economically inaccessible productive forests contain much valuable timber suitable for lumber and pulpwood. At present it is not economical to conduct cutting operations on these areas but as low-cost methods of transportation are developed, as accessible forested areas become depleted, and as the demand for wood products increases, these inaccessible productive forests will be brought progressively into commercial development. Owing generally to less favourable climatic conditions, the productive capacity of these inaccessible timberlands is expected to be less than that of the accessible areas now being logged.

* Obtainable from the Queen's Printer, Ottawa, price \$1.50.

The strong tendency on the part of many people to evaluate Canada's forest resources in terms of timber alone is understandable. Timber is the most obvious product of forest land and commonly the chief marketable commodity. The non-timber values of the forests, while of great economic importance, have been relatively neglected. However, increasing recognition of these great national assets is developing a broader concept of forestry.

Forest resources are inventoried periodically by provincial forest authorities and, with their co-operation, the Forestry Branch of the Department of Resources and Development compiles the National Forest Inventory. The latest estimates of accessible and total forest stands in the ten provinces and in the Yukon and Northwest Territories appear in Table 1. These estimates are subject to constant revision as more accurate and complete inventories are prepared.

¹ Cubic volumes do not include wood in stumps and unusable tops.

² Exclusive of Labrador.

³ Including estimates of inaccessible stands in the Yukon and Northwest Territories.

Forest Land Tenure.—Private individuals or corporations own 7 p.c. of Canada's total forest land. The remaining 93 p.c. is still in the possession of the Crown in the right of the Federal Government or of the provinces: rights to cut

Crown timber under lease or licence have been granted on 15 p.c. of the total forest land. Some of the unalienated land has already been logged and has reverted to the Crown but, in the main, it is located in the inaccessible and less accessible areas.

The distribution of occupied Crown forest lands and privately owned forest lands, by provinces, appears in Table 2.

Farm woodlots on the 623,000 farms across Canada cover over 22,780,000 acres (Census of 1951)—13 p.c. of the total farm area and over 7 p.c. of the total accessible productive forest. These small wooded tracts, ranging in size from three or four acres to 200 acres or more, are among the most accessible forests in Canada. Further, the woodlots of Eastern Canada are, in general, highly productive because they lie in the southern parts of the country and frequently occupy soils which are considerably higher in quality than those typical of the northern forests.

2.—Tenure of Occupied Forest Lands, by Provinces, 1951

Section 4.—Forest Depletion and Increment

A general account of forest depletion and increment is presented in this Section. Details of the scientific control of those influences that account for wastage, viz., forest fires and insect pests, are dealt with in Section 5, Forest Administration.

Depletion.—The average annual rates and cause of depletion of reserves of merchantable timber during the ten years 1940-49, are given in Table 3. Of the total depletion, 79 p.c. was utilized and 21 p.c. was destroyed by fire, insects and disease. The utilization of 2,776,128,000 cu. feet comprised 39 p.c. logs and bolts, 31 p.c. pulpwood, 26 p.c. fuelwood, and the remaining 4 p.c. miscellaneous products. Approximately 6 p.c. of the wood utilized was exported in unmanufactured form.

The more efficient utilization of timber that has been cut is one factor related to forest depletion. There is little doubt that in the past too high a percentage of the sawn logs was discarded. Changes of great significance have been taking place in the uses of wood, permitting the utilization of sizes and qualities unmerchantable as sawn lumber. The development of the manufacture of rayon, cellophane and numerous other products in the cellulose industry is rapidly extending the use of

wood. Plastic-wood products, fibre board and laminated wood are providing an increasing demand for the so-called inferior classes of wood resulting in more complete utilization of the forest resources and in the elimination of much waste.

3.—Average Annual Forest Depletion during the Period 1940-49

Increment.—The area of occupied forests in the country totals about 294,000 sq. miles, or 188,000,000 acres. This area includes some land that cannot be classified as productive forest land as well as some water. While precise information is not yet available, the net land area of occupied productive forest is estimated to be not more than 70 p.c. of the total occupied area, or 132,000,000 acres.

Almost all of Canada's primary forest products are obtained from these occupied productive regions. During the post-war period the average annual rate of felling on this area exceeded 25 cu. feet per acre. When an allowance for losses caused by fire, insects and disease is added, the average annual rate of depletion for the whole area approaches 30 cu. feet per acre. In many localities, however, this rate has been greatly exceeded; in others, it has been considerably less. Complete estimates of the rates at which the forests of Canada grow are not yet available. The vast size of the country, the diversity of growing conditions and the complex character of the forests place great difficulties in the way of estimating growth. However, the results of numerous studies indicate that over considerable tracts growth exceeds 25, 30 or even 40 cu. feet per acre per annum, but in other areas classed as productive the growth is much less. It seems probable, therefore, that considerable portions of Canadian forests are being cut too heavily at present. Large areas of productive forest still remain unoccupied and, while some unoccupied forests may prove to be quite as productive as those now occupied, a large proportion is difficult of access and is of relatively low productivity. The general situation emphasizes the urgent need for more intensive sustained-yield forest management.

Section 5.—Forest Administration

Subsection 1.—Administration of Federal and Provincial Timber-Lands

The major proportion of the forest resources of Canada are owned and administered by the provincial governments. The Federal Government is responsible for the administration of those of the Yukon and Northwest Territories and other federal lands such as National Parks and Forest Experiment Stations. About 97,000 sq. miles are privately owned by individuals or corporations.

The Federal Government's chief responsibility in the field of forestry is to carry out research in problems affecting Canada's forests and their development, conservation and more effective utilization. The Canada Forestry Act, 1949, provides that the Federal Government may enter into agreements with provincial governments, corporations and individuals to develop and conserve Canada's forest resources. Agreements under negotiation provide that during the next five years the Federal Government will pay one-half the cost, to the provinces, of making and maintaining their forest inventories, and one-fifth of the cost of reforestation of provincial unoccupied Crown lands.

The general policy of the Federal Government and the provincial governments has been to dispose of the timber under their jurisdiction by means of licences to cut, rather than by the outright sale of timber-land. Under this system the Crown retains ownership of the land and control of the cutting operations. Revenue is received in the form of Crown dues or stumpage (either in lump sums or in payments made as the timber is cut); ground rents and fire-protection taxes are collected annually. All these charges against the timber and land may be adjusted at the discretion of the governments concerned.

The three Maritime Provinces did not adopt this policy to the same extent as did the rest of Canada. In Prince Edward Island practically all the forest land has been alienated and is in small holdings, chiefly farmers' woodlots. In Nova Scotia 73 p.c. of the forest land is privately owned; holdings exceeding 1,000 acres make up more than one-half of this area. In New Brunswick 50 p.c. is under private ownership. The percentages of privately owned forest land in the other provinces are as follows: Newfoundland, 16 p.c.; Quebec, 8 p.c.; Ontario, 6 p.c.; Manitoba, 7 p.c.; Saskatchewan, 9 p.c.; Alberta, 7 p.c.; and British Columbia, 4 p.c.

Provincial lands suitable for growing trees are set aside for timber production and the policy of disposing of the title to lands fit only for the production of timber has been virtually abandoned in every province of Canada. More detailed information regarding forest administration in each of the provinces, except Newfoundland, is given in the Year Book 1942 at pp. 234-236.

About 1,600 professionally trained foresters are employed in Canada by the Federal Government, by provincial forest services, or by pulp and paper and lumber companies. The staff working for the Federal Government are almost entirely engaged in research; those employed by the provincial governments devote their attention mainly to the administration of provincial forest lands; while those in private industry, although they do some research, are concerned chiefly with forest management and protection.

4.—Forest Reserves in Canada, by Provinces, 1950

NOTE.—Areas of National and Provincial Parks (which are also forest reserves) are not included in this table, but will be found in Table 3, at p. 23.

Province	Federal Forest Experiment Stations	Provincial Forest Reserves	Total
	sq. miles	sq. miles	sq. miles

British Columbia.....	—	37,912.05	37,912.05
Totals.....	202.11	217,635.45	217,837.56

¹ Under National Park reservation and therefore not included in total. ² In Saskatchewan, the Northern Forest, established in 1950 with an area of 136,869.73 sq. miles, is comprised of all unalienated lands in the northern part of the Province and includes a number of provincial forests formerly listed separately.

Recent Advances in Forest Management Programs.—During recent years an increasing interest has been shown by governments and industry alike in programs to stimulate production of forest products and, at the same time, perpetuate Canada's forest resources. Most of the provinces require timber operators on Crown lands to submit forest inventories of their cutting areas and to prepare management plans covering operations for a stated period of time.

Saskatchewan has demonstrated the necessity for conservation of its forest resources by curtailing the annual cut to an amount approximating 5 p.c. of the estimated stand of merchantable spruce saw-timber in each particular district.

In British Columbia the granting of forest-management licences under authority of an amendment in 1947 to the British Columbia Forest Act will, undoubtedly, lead to a great improvement in forestry practice in that Province. Continuity of tenure, which is essential to the successful operation of a sustained-yield program is assured by these licences by which the Minister of Lands and Forests of British Columbia may enter into long-term timber agreements. In 1948 a further amendment to the British Columbia Forest Act established a Forest Development Fund of \$2,500,000 for the building of forest roads and bridges, intended for the economical harvesting of forest products. One company in British Columbia has recognized the need for long-term planning by the establishment of an experimental demonstration forest to study the problems involved in thinning, selective cutting and reforestation in stands of immature timber.

The Provinces of Nova Scotia, New Brunswick and Ontario have each appointed an Advisory Committee composed of representatives of the Provincial Government, the forest industries and other organizations interested in the welfare of the forests, so that forest problems might be discussed and a concerted effort made to solve them for the benefit of all. Efforts are being made, especially in Quebec and Ontario, to encourage the establishment and maintenance of forests on a community basis.

Another aspect of forest management receiving active attention is the collection of more accurate inventory records of forest resources. The provinces, under the stimulus of the Canada Forestry Act, are embarking on programs designed to inventory adequately their forest areas.

The use of air photographs for forestry purposes is a comparatively new field in which progress has been made in both research and practice (*see* p. 461). By the use of such photographs the Forestry Branch of the Federal Department of Resources and Development has been continuing its work on the aerial forest mapping of federally administered lands and other territories of direct concern to Canada. Forest inventory maps are, for example, being prepared from air photographs of the Eastern Rockies Forest Conservation Area. Data are being collected on the ground to support the interpretation of the photographs and the development of instrumental aids is being continued.

Timber Control.—The formal control of timber by the Timber Controller, as established during the war years, ceased on Mar. 31, 1950. Since that date the only controls have been those exercised through licences for the export of logs and pulpwood, required under the authority of the Export and Import Permits Act.

Subsection 2.—Forest-Fire Protection

The Federal Government is responsible for fire-protection measures in the forests under its administration—chiefly those of the Yukon and Northwest Territories, the National Parks, Indian lands, and Forest Experiment Stations. Each of the provincial governments, except that of Prince Edward Island, maintains a fire-protection organization co-operating with owners and licensees for the protection of timbered areas, the cost being distributed or covered by special taxes on timberlands.

In each province, with the exception just mentioned, provincial legislation regulates the use of fire for clearing and other legitimate purposes, and provides for close seasons during dangerous periods. The Province of Quebec has organized a number of co-operative protective associations among lessees of timber limits. These associations have their own staffs, which co-operate with those of the Board of Transport Commissioners and the provincial government. The latter contributes money grants and also pays for the protection of vacant Crown lands lying within the area of the associations' activities. In the Province of Newfoundland, responsibility for the protection of most licensed timberlands is vested in the lessees and the Newfoundland Forest Protection Association, maintained jointly by government and industry, carries out certain important fire-control functions.

The provincial services of forest-fire protection along railway lines are assisted by the Railway Act, administered by the Board of Transport Commissioners. The Board has wide powers relating to fire protection along railway lines under its jurisdiction. Certain officers of the various forest authorities are appointed ex-officio officers of the Board of Transport Commissioners and co-operate with the fire-ranger staffs which the railway companies are required to employ under the Railway Act.

In many districts in Canada, radio-equipped aircraft are used to good effect for the detection and suppression of forest fires. Where lakes are numerous, seaplanes or flying boats can be used for detection and for the transportation of fire-fighters

and their equipment to fires in remote areas. In Western Canada, equipment and supplies are sometimes dropped by parachute to isolated fire crews, or parachutists are employed to fight fires difficult of access by other means.

Fire detection in more settled areas is carried out by means of lookout towers fitted with telephone or radio for reporting and field staffs and equipment are maintained at strategic points. These staffs, when not engaged on fire-control duties, are employed on the construction and maintenance of roads, trails, telephone lines, fire guards and other improvements.

Portable gasoline pumps and linen hose are important equipment and may be carried by canoe, motor-boat, automobile, aircraft, pack-saddle or back-pack. They can provide hose pressures of up to 200 lb. per sq. inch, depending upon the elevation above and distance from the water supply; hose lines of over a mile in length are frequently used. Small hand-pumps supplied by 5-gallon portable containers are also found effective. Bulldozers or ploughs are commonly used for fire-line construction while trucks fitted with water tanks and power pumps are employed for the control of fires adjacent to roads.

The various governmental forest authorities conduct forest conservation publicity work independently and in co-operation with the Canadian Forestry Association. Since its beginning in 1900, that Association has played an important part in securing popular co-operation in reducing the fire hazard. By means of its magazine, which has a large circulation, by railway lecture cars and motor-trucks provided with motion-picture equipment, and by co-operation with radio broadcasting stations and the press, the Association reaches a large proportion of the population of Canada. Efforts are made through the schools, by specially appointed junior forest wardens and other means, to educate the younger generation as to the value of the forests, the devastation caused by fire and the means of preventing such destruction.

Forest Fire Statistics.—The total number of 5,310 forest fires in 1950 was slightly lower than the previous ten-year average of 5,431, although the total area burned, 2,226,765 acres, was 10 p.c. higher than the average loss for the previous 10 years. Fire-fighting costs did not approach the record-breaking totals of 1949 but they did represent an increase of 50 p.c. compared with the average for the preceding ten-year period. The weather in Newfoundland and Nova Scotia was quite dry for the greater part of the fire season, although temperatures were not excessive, and the seriousness of the fire danger conditions in the latter Province necessitated forest closure to travel during June, July and most of August. New Brunswick also experienced a few days of serious fire danger in the spring but, in general, the fire season was considered favourable in the Province as a whole. The forests of Quebec and Ontario were generally drier than normal in the spring but nearly average conditions obtained for the remainder of the season. Manitoba and Saskatchewan had a very favourable fire season. Serious fire dangers occurred in the northern and central portions of Alberta during May, June and October, but better-than-average conditions obtained elsewhere throughout the Province. In British Columbia, the Yukon and Northwest Territories, in the spring, wet weather prevailed generally and during the remainder of the fire season there were only a few isolated instances of the fire danger reaching serious proportions.

Subsection 3.—Research in Forestry

Forest research and forest-products research facilities have been greatly expanded throughout Canada during the past five years. The Federal Government, several provincial governments, the Pulp and Paper Research Institute of Canada, the four universities with faculties of forestry, and a number of the larger industrial companies conduct research in these fields. The Forestry Branch of the Federal

Department of Resources and Development conducts research in silviculture, management, forest air-surveys, forest-fire protection and forest economics. District offices and forest experiment stations are maintained in Newfoundland, New Brunswick, Quebec, Ontario, Manitoba and Alberta. An extensive program of research is under way on the experiment stations and on other lands, where an increasing proportion of the total effort is being expended in co-operation with provincial authorities and industry.

Research in silviculture and management has been concentrated since World War II upon problems of regeneration, growth and stand development, and harvest cutting methods. A regeneration survey extending from the Rocky Mountains to the Atlantic coast has provided information on the status of regeneration on cut-over and burned lands and has been followed by more intensive work to assess the factors responsible for the success or failure of regeneration and to devise practical methods of obtaining reproduction. Studies are made of growth and succession in the most important forest types and of development of a satisfactory basis for classifying forest sites for effective growth and productivity. Research in tree breeding is also carried on for artificial propagation by selection and development of superior strains. Research in forest management devises methods of applying the knowledge of silviculture, regulation of cut and protection in order to manage the forest at its highest production level. A management plan has been prepared for a 300 sq. mile area to be operated by a large pulp and paper company as a demonstration sustained-yield unit.

Forest-fire protection in Canada is a vital problem, and is therefore a major concern of federal and provincial forest authorities. Forest-fire protection of Crown lands is the responsibility of provincial forest services but federal-owned forest lands such as the National Parks, the forest experiment stations, and those in the Yukon and Northwest Territories are the responsibility of the Federal Government. Other organizations responsible for forest-fire protection within their respective territories are the forest protective associations in Quebec and company organizations on privately owned forest land in Nova Scotia and British Columbia. In the field of forest-fire research, the Federal Forestry Branch is working towards full co-operation with the provincial forest services in achieving the best methods of forest-fire protection. The leading contributions of the Branch to date have been in the field of fire-hazard research and in the development of equipment and techniques for fire fighting. Increasing attention, however, is being given to research in such fields as fire-control planning, visible area mapping, detection and communications equipment, and the training of fire crews. A number of provincial forest-protection services are also engaged in research activities. Notable advances have been made in several provinces in the development of forest communications equipment, the dropping of supplies to fire fighters by parachute, and the design of mechanical fire-fighting equipment.

Research in forest air-surveying is of considerable importance because aerial photography provides an excellent means of obtaining reliable information on the extent, character and volume of forest resources. Data from air-photographs are correlated with field work to develop techniques of timber estimating. Statistical formulæ based on stratification and sampling are used for volume determination. Research is being continued in methods for measuring tree images and tree shadows to determine heights, crown widths, crown closure and other data from photographs taken in different seasons of the year under various conditions. Studies are

also being made in the identification of species and subtypes and the classification of forest sites by the use of air photographs. Construction of suitable photogrammetric and other scientific apparatus include the forestry tri-camera method of air photography, which has been developed to provide maximum forestry information at minimum cost; the use of photo-lithographic methods for the reproduction of general forest inventory maps in full colour; and the Shadow Height Calculator, constructed to facilitate the determination of tree heights from shadows in air photographs.

Research in forest economics includes studies and analyses of forest taxation (federal and provincial) and land tenure. A study of the economics of forest management was undertaken on a pulpwood limit in Quebec with a view to the development of a technique for calculating the costs relating to the management of a forest area on a sustained-yield basis and thus provide a model for estimating the cost factors involved for similar forest areas.

Forest Products Research.—Two Forest Products Laboratories conduct forest products research, one at Ottawa, Ont., and the other at Vancouver, B.C. The purpose of this research is to supply the basic and practical knowledge required for the best possible utilization of Canada's forest resources and includes studies of the factors affecting the quality of wood and of manufactured wood products; the factors causing wood waste in logging and manufacturing; the mechanical, physical and chemical properties of wood and their relation to adaptability in use; the treatment of wood and its use in the manufacture of fibre products, alcohol, turpentine, etc.; new and more valuable uses for woods; and the application of laboratory findings to the standardization of lumber grades and the improvement of timber specifications in the building codes of Canadian cities. The Forest Products Laboratories co-operate with similar organizations in other countries, with the provinces and with industry.

The Pulp and Paper Research Institute of Canada at Montreal, Que., a corporation supported by the Federal Government, the Canadian Pulp and Paper Association and McGill University, carries out research in the field of pulps and papers. The program of work includes studies of the structure and properties of wood and bark and their chemical components; the improvement of pulping processes; studies for the improved utilization of waste products; and the improvement in the design of industrial equipment.

The Forest Insects Control Board.—The Forest Insects Control Board operates under the Federal Department of Resources and Development and is composed of nine members representing the Federal and Provincial Governments and the pulp and paper industry. Its purpose is to advise the Minister of Resources and Development concerning methods for control and destruction of insects injurious to the forests of Canada and for the prevention of loss and damage from the attacks of such insects.

Forest Biology.—The Division of Forest Biology of the Science Service, Federal Department of Agriculture, undertakes investigations dealing with the biology and control of insects affecting forest and shade trees and forest products. Ten regional laboratories are maintained at strategic points across the country. The Forest Pathology Unit operates four branch laboratories, one of which, recently established at Sault Ste. Marie, Ont., was designed particularly for fundamental research on virus, fungus and bacterial diseases of insects.

A special article dealing with Noxious Forest Insects and Their Control appears in the Year Book 1947, pp. 389-400. A detailed account of the activities in forest pathology in Canada may be found in the Year Book 1948-49, pp. 416-417.

Section 6.—Forest Utilization

Forest utilization is concerned with the many industries employed in the hewing down of timber in the forest and the transforming of it into the numerous utilitarian shapes and forms required in modern living. The basic industries provide the raw material for sawmills, pulp and paper mills and for the wide range of secondary industries that convert the products of the basic industries into more highly manufactured goods such as veneers and plywoods, sash and doors, furniture and all the vast range of industries that use wood in any form in their processes. These industries, especially the pulp and paper industry and the lumber industry, contribute substantially to the value of Canada's export trade and thereby provide the exchange necessary to pay for a large share of the imports that have to be purchased from other countries, particularly the United States.

Subsection 1.—Woods Operations

In connection with operations in the woods, it should be borne in mind that the forests not only provide the raw materials for the sawmills, pulp-mills, wood distillation, charcoal, excelsior and other plants, but that they also provide logs, pulpwood and bolts for export in the unmanufactured state, and fuel, poles, railway ties, posts and fence rails, mining timber, piling and other primary products which are finished in the woods ready for use or exportation. A number of minor forest products go to swell the total, such as Christmas trees, maple sugar and syrup, balsam gum, resin, cascara, moss and tanbark.

It has been estimated that operations in the woods during the logging season in 1949 gave employment amounting to 37,836,000 man days, and distributed \$321,000,000 in wages and salaries.

8.—Values of Woods Operations, by Products, 1944-49

Product	1944	1945	1946	1947	1948	1949

¹ In estimating the annual drain on Canada's forest resources, certain converting factors have been used, each of which represents in cubic feet the quantity of merchantable wood used to produce one unit of the material in question. The factor for logs and bolts for the British Columbia coastal region is 175 and for the rest of Canada 200. Other factors: pulpwood 85, fuelwood 80, hewn railway ties 5, poles and piling 15, fence posts 1.2 and wood for distillation 80. A change in computing the converting factor was introduced in 1944-45 and is described at pp. 265-266 of the 1946 Year Book.

10.—Equivalent Volumes of Solid Wood Cut and Values of Products of Woods Operations, by Provinces, 1947-49

Subsection 2.—The Lumber Industry

The manufacture of sawn lumber is the second most important industry in Canada depending on the forest for its raw materials.

The total number of sawmills, tie, shingle, lath, veneer, stave, heading and hoop mills and mills for cutting-up and barking or rossing of pulpwood reports of which were compiled for 1949 was 7,460, as compared with 7,035 for 1948; the increase is attributable to the inclusion of the Province of Newfoundland in the later year. Mills sawing less than 15,000 ft. b.m. are excluded but account for less than one-half of one percent of the total lumber production. Employees numbered 55,032 and wages and salaries amounted to \$97,449,091. The logs, bolts and other materials and supplies of the industry were valued at \$205,935,217, the gross value of production was \$396,415,201 and net value \$186,120,981.

Lumber production in Canada reached its maximum in 1949 at 5,915,443,000 ft.b.m. Average values were fairly uniform until 1916, but increased rapidly from 1917 to 1920, to decline gradually during the following years to the lowest level for the entire period in 1932. With the exception of 1938, increases took place each year from 1933 to 1949.

11.—Quantities and Values of Lumber and All Sawmill Products, by Provinces, 1948 and 1949

Lumber Exports.—For exports of planks, boards and square timber see Chapter XXI, Foreign Trade.

Subsection 3.—The Pulp and Paper Industry

Most of the textual information and the tables normally appearing under this heading have been incorporated, in this edition, in the Special Article on "The Pulp and Paper Industry in Canada". The exceptions are wood-pulp statistics of leading countries and the world newsprint statistics which are given in the following paragraphs.

World Pulp Statistics.—Figures of production, exports and imports of pulp for certain countries of the world have again become available after the interruption caused by World War II and are shown for 1950 in Table 14. It is estimated that these countries produce approximately three-quarters of the world supply of pulp.

14.—Production, Exports and Imports of Wood Pulp, by Leading Countries, 1950

(Source: United States Pulp Producers Association)

Country	Production	Exports	Imports
	'000 tons	'000 tons	'000 tons
Canada.....	8,371 ¹	1,846	37
United States.....	14,811	96	2,385
Finland.....	2,109	1,142	—
Norway.....	1,185	608	23
Sweden.....	3,488	2,305	1

¹ Slightly lower than Dominion Bureau of Statistics figures given in Table 2, p. 469, owing to the exclusion of certain types of pulp by the Association.

World Newsprint Statistics.—Since 1913, Canada has led the world in the export of newsprint. Figures for the leading producing countries for the two latest years available are given in Table 15; 1939 figures are included for comparative purposes. The six countries listed accounted for 81 p.c. of the estimated world production in 1950, Canada contributing over 54 p.c.

15.—Estimated World Newsprint Production and Exports, by Leading Countries, 1939, 1949 and 1950

(Source: Newsprint Association of Canada)

THE PULP AND PAPER INDUSTRY IN CANADA*

The manufacture of pulp and paper has been the leading industry in Canada for many years, and the post-war development of the industry has more than kept pace with the vast industrial growth of the nation. Pulp and paper stands first among all industries in value of production, in exports, in total wages paid and in capital invested. It is the largest consumer of electric energy and the largest industrial buyer of goods and services, including transportation, in the land. The industry has a newsprint output five times that of any other country and provides for over one-half the world's newsprint needs. Canada is also the world's greatest wood-pulp exporter and stands second only to the United States as a producer of pulp. Thus this Canadian industry, with four-fifths of its output moving abroad, ranks as one of the major industrial enterprises of the world.

Paper was first manufactured in Canada early in the eighteenth century, but it was not until the 1860's, when wood-pulp began to supplement rags as a raw material, that the development of the industry began. The happy conjunction

* Prepared by the Forest Economics Section, under the direction of Dr. D. A. Macdonald, Director, Forestry Branch, Department of Resources and Development, in co-operation with the Canadian Pulp and Paper Association.

of Canada's extensive pulpwood and hydro-electric power resources, together with an ever-increasing demand for pulp and paper, have been mainly responsible for the growth of the industry.

The first Canadian paper mill was located at St. Andrews in Lower Canada and began to produce in 1805. By 1851 there were five mills in Upper and Lower Canada. The first chemical wood-pulp was produced in a soda pulp mill at Windsor Mills, Quebec, in 1864. By 1881 there were 35 paper mills and five pulp mills in Canada with a total of 1,586 employees and an annual output valued at \$2,500,000. The growth of the industry continued at an accelerated pace and from 1900 to 1920 the value of production of the pulp and paper mills increased thirty-fold. After weathering the depression years at a low production level, the pulp and paper industry was again at a 95 p.c. production capacity in 1938. The heightened demand during the War and post-war period added impetus to expansion of the industry, until in 1950 there were 123 pulp and paper establishments in Canada producing 8,473,014 tons of wood-pulp, valued at \$502,583,925 and 428,461 tons of pulp made from rags, straw and other fibres, valued at \$13,073,199. Paper production totalled 6,812,035 tons valued at \$710,153,826. The gross value of production of the mills in 1950 was \$954,137,651, and in 1951 it totalled approximately \$1,200,000,000.

Woods Operations.—Vast forest resources and abundant sources of power, together with the low cost of transporting logs to the mills by a broad network of rivers and streams, have brought about the rapid development of the pulp and paper industry. This industry is the largest tenant of the forest, holding 158,125 sq. miles in 1951 or almost 33 p.c. of the accessible productive forest area of Canada. The industry also owns some timber lands outright, but these remain a minor factor in pulpwood supply.

The pulpwood consumption of the mills in 1950 amounted to some 11,000,000 cords of which 67 p.c. was cut on the leased or freehold limits of the industry. The remaining 33 p.c. of the wood was purchased. Two-thirds of the purchased wood came from farmers and other small holdings.

The nature of the topography, climate and forests of Eastern Canada are such that the cutting and hauling of logs can be carried out most economically during the autumn and winter months. Spruce, balsam fir, jack pine, poplar and other species are felled and the logs are hauled to the nearest streams where they are piled on the ice. Many operations use trucks and tractors and there has been a general increase in the use of mechanical logging methods in Eastern Canada. When the ice breaks up in the spring, the logs are floated down the river to the mills. In British Columbia larger Douglas fir, western hemlock and Sitka spruce logs are assembled by donkey engines, cable systems and tractors, and are transported to the mill, to tide water or to lakes by heavy-duty trucks and trailers or by logging railway. Logs taken to lakes or tide water are assembled into booms and towed to the mills. Logging operations on the west coast are carried out in most instances throughout the year. A great deal of the material used by the pulp mills is sawmill waste such as slabs and edgings.

Manufacturing Processes.—Pulpwood logs come to the mills either by floating down a convenient stream, by truck, by railway, or by water transport. On arrival the bark is removed in barking drums. Slightly different wood-handling methods are employed by the Pacific coast mills.

Wood is made into paper by first converting it into pulp. Two pulping methods are used, one mechanical and the other by cooking with chemicals. The mechanical process produces groundwood pulp, which is exactly what its name implies. Wood is reduced to fibre by pressing against large revolving grindstones. Hence large quantities of power are required. The yield of groundwood or mechanical pulp approximates 97 p.c. of the weight of the wood.

In the chemical process small chips of wood, about three-quarters of an inch in length, are cooked at high temperatures and under pressure in a chemical liquor. The cooking, requiring several hours, dissolves virtually everything in the wood other than the cellulose. The yield of pulp is therefore reduced to from 45 to 50 p.c. of the weight of the wood. Three such chemical pulping processes are employed to produce sulphite, sulphate, or soda pulp which obtain their names from the acid or alkali employed in the cooking process.

Paper is made from pulp which, thinly mixed in water, travels in a wide stream on to the wet end of the paper-making machine. As the pulp and water move ahead on a travelling screen, the water is removed from the pulp, which then passes over a series of heated revolving drums in the dry end of the machine where the paper emerges. Thus, the paper is the result of a process of felting and drying the cellulose fibres of the original wood. Machine speeds vary with design as well as the type and weight of the paper made. Some machines produce newsprint at the rate of close to 2,000 ft. a minute. About 250 tons of water may be used to produce one ton of paper.

The type of mixture of pulp employed determines the character of the paper produced. Newsprint is composed of about 85 p.c. groundwood and 15 p.c. unbleached sulphite pulp. Bleached sulphite pulp is the raw material from which is made the better grades of book, writing and tissue papers. When pulp is made for use as the raw material for rayon, cellophane, photographic film, nitro-cellulose and plastics, it is known as "dissolving pulp". Sulphate, or kraft pulp, in its unbleached form is used to produce wrapping and bag papers, container boards and other products in which strength is the prime requisite. When bleached, this pulp is used to manufacture white printing, tissue, tag, envelope and other papers and products in which strength is also essential. Soda pulp is made by pulping short-fibred, broad-leaved species such as poplar, but relatively small quantities are produced in Canada. The raw material of paper-board may include anything from waste paper and pulp screenings (the pulp rejected for paper manufacture) to the finest grades of chemical pulp. Its components vary with the quality and type desired. Canada produces also some pulp made from rags and other fibrous material. Rag pulp goes into the highest grades of paper.

Virtually all papers and paper boards made to-day contain ingredients other than cellulose fibres. Before the pulp goes to the paper machine, dye is added to produce the colour desired. A filler such as china clay, or a size such as resin, or both, may also be added—filler to improve printability, opacity and appearance and size to increase resistance by liquids. To improve the surface of some high-

grade papers and paper boards, the finished sheet is coated by spreading a mixture of mineral matter, adhesives, waxes or waterproofing agents on the surface of the sheet.

Between 1913 and 1930 the Canadian newsprint industry experienced a rapid and spectacular growth; by 1925 it had become the world's largest producer. Following the period of high prices and wide prosperity during the 1920's, the effect of the depression on the industry was devastating. Thus, between 1929 and 1932, when new Canadian mills and machines were still being completed and searching for business, the output of Canadian newsprint dropped by almost 30 p.c. In 1935 demand began to show improvement and in 1937 the industry was operating at 95 p.c. capacity. In the eight succeeding years which included World War II, newsprint production figures and values were relatively stable. After the War, tonnages and values rose rapidly, and during the six-year period 1945 to 1950 output increased by 60 p.c.

The industry's output of products, other than newsprint, has expanded in a spectacular fashion in the past thirty years. The production of pulp for sale increased two and one-half times; paperboard production increased to nearly eight times its 1922 total; wrapping paper production almost trebled; book and writing paper more than trebled; the output of tissue paper increased to almost twenty times its 1922 level, and all other paper grades, excluding newsprint, increased five-fold.

High tariffs, both in the United States and overseas, have limited the markets for paperboard and fine papers and output goes chiefly to the domestic market. The manufacturers have steadily increased the number of standard and specialty grades which they have produced, and have developed a wide variety of industrial papers for use in the electrical industry and in the manufacture of paperboard containers, paper cups, towels and grease-proof papers for food.

External Trade.—The level of domestic trade, the national income, and the standard of living in Canada depend largely on the flow of Canadian exports abroad. During the 15 years from 1927 to 1941, pulp and paper accounted for from 14 to 24 p.c. of the total value of Canadian exports. From 1920 to 1941 pulp and paper exports were never less than 12 p.c. of total exports. In the post-war years, 1947 to 1951, pulp and paper has accounted for from 20 to 25 p.c. of the total value of all Canadian exports.

Because of the high level of munitions production during the war years, pulp and paper occupied a less dominant position in the export market. Nevertheless, from 1943 to 1945 pulp and paper comprised between 8 and 10 p.c. of total Canadian exports. With the return of peace, the industry immediately climbed back to its position as Canada's largest single exporter.

During the years 1925 to 1946, about 75 p.c. of Canadian pulp and paper production moved abroad. Of the pulp produced for sale, more than 85 p.c. was exported. In 1950 about 77 p.c. of the entire production of pulp and paper was exported, accounting for nearly one-quarter of all Canadian exports.

The chief market for Canadian newsprint and pulp is in the United States. Prior to the War this market alone absorbed about 85 p.c. of the pulp exports and 80 p.c. of the newsprint exports. In 1945 the proportions were 71 p.c. and 83 p.c., respectively, and in 1950, 80 p.c. and 96 p.c., respectively.

Importance of the Industry in the Canadian Economy.—The pulp and paper industry is one of the larger contributors to the public purse in Canada. Taxes and payments of all kinds to governments run to \$135,000,000 annually, but the extent to which the industry contributes to the national welfare cannot be assessed solely on this basis. Its operations create vast additional sources of government revenue including: hydro-electric facilities built to meet the power requirements of the industry; almost \$300,000,000 paid out annually in wages; a freight traffic alone involving the loading of more than 1,000 freight cars daily; and the operation of many converting industries ranging from the publishing trades to the manufacture of cartons, plastics and rayons. The significance of the industry in the economy may be judged also from the fact that it accounts for about one-third of all the power used by industry and in mining; that it accounted for almost one out of every eight revenue freight cars loaded in Canada in 1951; that the value of its output exceeds the mineral production of Canada including gold and all metallics, coal, gas, and petroleum; that its exports are close to twice the value of wheat and all other exports of grain; and that it expends annually \$72,000,000 for chemicals and mill supplies, \$44,000,000 for fuel, and \$100,000,000 for other purchases. Indeed, the gross value of the production of the industry exceeds 5 p.c. of the gross national product of Canada.

The pulp and paper industry uses the products and services of other Canadian industries on a wide scale, from agriculture to insurance and from retailing to rail-roading. Many branches of the national economy derive revenues or benefits from pulp and paper operations. The industry is a larger buyer of goods and services than any other manufacturing industry in Canada.

Including woods-workers, close to 280,000 Canadians received pay from the pulp and paper industry in 1950, which means that about 1,000,000 Canadians depend directly on the industry, in whole or in part, for their livelihood. Sums paid to workers in 1950 ran to an estimated \$270,000,000. Employees in the mills received in salaries and wages \$169,246,531, and workers in the woods an estimated \$101,000,000. In that year the industry, in the mills alone, employed 52,343 people.

In addition, the industry provides seasonal work in the woods for about another 225,000 workers. Except in British Columbia, woods-workers are employed chiefly on a seasonal basis. While the industry is the largest exporter of manufactured goods in Canada, the products that it manufactures for home consumption loom large in domestic trade.

Outlook.—To-day there is an urgent need throughout the world for pulp and paper products of all kinds. Pulp, formerly used merely for paper, is in increasing demand as raw material for the fabrication of rayon, cellophane, plastics, building and packaging materials and many other products.

The main pulpwood sources of the world lie in the forests of the Union of Soviet Socialist Republics, the United States, Canada and Scandinavia. In the United States, pulp and paper consumption far exceeds that country's production of pulpwood. Production of wood-pulp in Scandinavia appears to have reached the productive capacity of the forests in that area. No extensive development for pulpwood of the tropical forests of the world appears imminent, and any considerable increase in pulp and paper production in the Soviet Union could be absorbed within that country. Thus, it is apparent that for some time to come the task of supplying a major portion of the pulp and paper demand of the free world must fall to Canada. In meeting this need, the pulp and paper industry can contribute in no small measure to the stability of the Canadian economy, particularly in the years that lie immediately ahead.

With vast supplies of wood, streams to float the logs to the mills, and abundant electric power for their conversion into pulp and paper, the resources of the industry are unsurpassed anywhere and from these resources flow an essential commodity—one which is the very currency of civilization. All these advantages and qualities would be meaningless, however, if the industry could not dispose of its products. So far as Canada is concerned, it is largely an export industry and, as such, must depend for its existence on its ability to secure and maintain export markets.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Section 1.—Canada's Mineral Resources

The mineral resources of the provinces of Canada are dealt with in some detail in the 1951 Year Book, pp. 486-495. The following Special Article, together with the article on pp. 524-527, gives an account of the tremendous expansion that has taken place in the development of those resources since the end of World War II.

POST-WAR EXPANSION IN CANADA'S MINERAL INDUSTRY†

In the light of its remarkable growth since World War II, mining in Canada can well be described as an industry on the march. True, inflationary prices have accounted for much of the increase in the value of its output from \$498,755,181 in 1945 to a record \$1,228,000,000 in 1951 for, like that of practically every other commodity, the price of almost every metal and mineral produced in Canada has risen sharply since the War. However, the total volume of mineral production has also increased, the figure for 1951 being about 65 p.c. higher than that for 1950.

In any event these volume and value increases provide only part of the record of the expansion that has taken place. The real story lies in the many outstanding developments that have occurred in the past seven years and that have literally transformed much of the Canadian mining landscape. The article entitled "Canadian Crude Petroleum Situation", at pp. 524-527, gives a descriptive account of what is, beyond question, the greatest of these developments.

Next in importance—in fact equally as important in many respects—are the iron ore developments, and here, too, the *before* and *after* contrasts are sharp. Prior to 1939, Canada produced little or no iron ore. The requirements of the

* Except where otherwise noted, this Chapter has been revised in the Mining, Metallurgical and Chemical Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

† Prepared under the direction of Marc Boyer, Deputy Minister, Department of Mines and Technical Surveys, Ottawa, by G. H. Murray, Chief, Editorial and Information Division, and Mrs. M. J. Giroux of the Editorial staff.

Canadian steel industry were met by imports, mainly from the United States, and from Newfoundland, which entered Confederation in 1949. From 1939 until 1944 the entire Canadian output came from the Helen mine of Algoma Ore Properties Limited in the Michipicoten area of Ontario.

Meantime, two events occurred which were to change the outlook completely—the discovery of large deposits of hematite in the Steep Rock area 140 miles west of Port Arthur in Ontario, and the disclosure of large deposits of this ore in the Quebec-Labrador region. In both cases the discoveries were made just prior to World War II. Currently, both areas are sharing the limelight and, in addition, the huge Wabana deposits in Newfoundland now comprise a part of Canada's wealth of iron ore.

From here on, the order of importance of the outstanding post-war developments in mineral production would be difficult to appraise. Whether it be the disclosure of large quantities of natural gas in Alberta or the discovery of deposits of titanium ore in eastern Quebec, the discoveries of asbestos in British Columbia and Ontario, the huge aluminum project at Kitimat in British Columbia, or a number of other enterprises of varying importance that could be mentioned, it is evident that Canada has been witnessing the greatest wave of mineral resources development in its history.

Actually, this expansion developed somewhat slowly at first. There was an abrupt slackening in the demand for most mine products during 1946 when the industry in Canada and elsewhere was in the process of readjustment to a peacetime basis. Soon, however, the effects of the curtailment in the output of civilian goods during six years of war became evident in a demand for such goods far in excess of any ever experienced.

The setting for an expansion of the country's mineral economy was close to ideal. Prices were rising, there was every reasonable assurance of a prolonged demand for mine products and industry as a whole in Canada was expanding rapidly, thus adding to the demand for mineral raw materials. If more were needed in the way of incentive it was provided in the discovery of the Leduc oil field in Alberta in February 1947. That event perhaps more than any other single post-war development brought Canada's mineral possibilities sharply into focus and caused Canadians and others to gain a new conception of the country's mineral estate, a conception that would have been regarded as visionary if not extravagant even 25 years ago.

The effects have been cumulative. The Leduc discovery has brought the whole Prairie region of several hundred thousand square miles into perspective as holding possibilities of further important discoveries and of resultant disclosures of natural gas; the high base-metal prices have brought within economic range several deposits of these metals in various parts of Canada which would otherwise have remained undeveloped, and have caused attention to turn to the re-examination of many long-dormant properties; the high prices for other mine products, coupled with the steadiness of the demand, have encouraged the establishment of new enterprises and the large-scale expansion of existing enterprises.

A cross-sectional survey of the nature and scope of this post-war expansion and of the more important developments follows, on a regional basis.

British Columbia.—This Province, whose mining history dates back to the discovery of gold in the gravels of the lower Fraser River close to a century ago and whose contribution to Canada's mineral output up to the end of 1951 has

amounted to upwards of \$3,000,000,000, has been experiencing a tremendous upsurge of mining and related activity. Practically every favourable section of the great expanse of Cordilleran rocks which underlie most of the Province has been receiving attention in the belief that these rocks contain much hidden wealth, a belief supported by encouraging results up to date. Modern means of transportation permit easier access to many areas that were formerly difficult to reach, and road improvements, power development and cheaper processing and extractive methods, coupled with high prices, make the development of prospects and properties in these areas feasible. Mineral discoveries made 30 to 50 or more years ago when primitive methods of transportation proved an effective barrier to their development, are now being reappraised.

From the outset the production of metals has been the mainstay of the Province's mineral economy and in 1951 accounted for 85 p.c. of the total value of the mineral output in that year. Lead, zinc, copper, gold and silver are the chief metals produced, the Province being the leading world producer of lead and zinc and well to the fore in silver production. Chief source of these three metals is the great Sullivan mine of the Consolidated Mining and Smelting Company of Canada Limited at Kimberley in the East Kootenay area. This Company, with its operations at Kimberley, its sprawling metallurgical plants at Trail, and its various other activities, forms the hard core of British Columbia's mineral industry. In addition to ores of the Sullivan mine the Company treats ores from over 100 properties in the Province on a custom basis and is the sole Canadian producer of tin and bismuth and a leading producer of cadmium and antimonial lead, and of fertilizer and other chemical products.

Practically all of British Columbia's output of copper has come from deposits in the western Cordilleran Region and in recent years mainly from Granby Consolidated Mining Smelting and Power Company's operations at Allenby and from those of Britannia Mining and Smelting Company at Britannia Beach. The output is in the form of copper concentrates which are shipped to the smelter at Tacoma, Washington, for recovery of the copper. The output in 1951 was 21,905 tons valued at \$12,096,306.

Placer gold mining has dwindled in importance over the years and much the greater part of the gold output now comes from gold-quartz mines in the Bridge River, Atlin, Hedley, and other areas. This production, too, has been declining sharply, the output of 202,130 oz t. in 1951 being less than one-half that of 1941. Base-metal operations account for the remainder of the output.

Iron ore and tungsten concentrates round out the list of metallic ores produced in British Columbia. Production of the former was never large and has been intermittent but, as noted later, there has been a revival of interest in the development of deposits. The tungsten concentrates come from operations in the Salmo area, to which reference is also made later. The Province accounted for all the Canadian output of 20,000 lb. of tungsten ore in 1951.

Though small in comparison with that of the metals, the Province's output of the non-metallic minerals has been increasing, a trend which seems likely to continue in view of recent developments, including the discovery of crude oil in the Peace River area near the end of 1951; the commencement of production from asbestos deposits discovered in the McDame area in 1950, and the expansion in the cement industry. Coal is the chief single contributor to the output of non-metallic minerals. Bituminous coking coal ranging from high to low volatile is

mined on Vancouver Island and in the Crowsnest, Telkwa, and Nicola areas. Lesser quantities of sub-bituminous coal are produced, mainly in the Princeton field. In 1951 coal was followed in order of production by sand and gravel, cement, stone, and clay products.

Foremost among post-war developments is the huge project of the Aluminum Company of Canada Limited at Kitimat, in the Prince Rupert area. This project involves the development of over 2,200,000 h.p. of hydro-electric energy through the construction of a dam on the Nechako River and includes also the construction of an aluminum smelter at Kitimat with a planned capacity of 500,000 short tons of aluminum a year. Output is expected to commence in 1954 at an initial rate of 100,000 tons a year. As in the case of Canada's present output of the metal, all the aluminum from the Kitimat project will be produced from imported ore. Cost of the project when completed is estimated at \$600,000,000.

Next in importance is the \$65,000,000 expansion program by the Consolidated Mining and Smelting Company. This includes modernization of the lead smelter at Trail at an estimated cost of \$12,000,000; construction of an addition to the electrolytic zinc refinery at Trail at a cost of \$3,200,000, mainly to handle increasing tonnages of custom ore as well as concentrates from the Bluebell and other properties the Company is preparing for production; construction of a fertilizer plant at Kimberley to have a capacity of 70,000 tons a year and to cost an estimated \$9,000,000 with completion scheduled early in 1953; construction of a \$30,000,000 power plant on Pend d'Oreille River, also scheduled for completion in 1953; and rehabilitation of the Company's Tulsequah Chief, H.B., Bluebell, and Big Bull mines.

Though other developments are on a smaller scale they are nevertheless impressive. The recent disclosure of large tonnages of much-needed tungsten ore in the Canadian Exploration Company's Dodger property in the Salmo area has resulted in great activity. The Company has been treating the tungsten ore of the Emerald mine for the Federal Government, which owns the tungsten section of the property, and capacity has been increased to 500 tons a day to permit handling of the Company's tungsten ore also. As a result, Canadian production of tungsten will be well in excess of domestic requirements by the end of 1952. The Company's nearby Jersey lead-zinc mine is also developing into a major operation and ore is being milled at a rate of 300,000 tons annually. In the same area, the Reeves MacDonald lead-zinc property which entered production in 1949 has since doubled its output of ore and is now handling about 1,000 tons a day. In the northern coast area the Tulsequah Chief and Big Bull copper-lead-zinc mines were brought into production by Consolidated Mining and Smelting Company in 1951, and preparations to start production of lead and zinc concentrates at the Company's Bluebell mine on Kootenay Lake at 500 tons a day and at its H.B. mine near Salmo at 1,000 tons a day are well advanced. A property near Spillimacheen, one at Ainsworth, and another near Cranbrook entered production in 1951 and a zinc-lead mine in the Revelstoke area is nearing production. As a result of these developments, a sizable increase can be expected in the Province's output of lead and zinc.

Most of the iron ore developments are on a small scale as yet but interest in the search for deposits and in the re-examination of properties has been increasing. Argonaut Company Limited, which took an option on the Iron Hill mine near Quinsam Lake on the east coast of Vancouver Island in 1949, commenced shipments of magnetite concentrate from the property in September 1951. The ore is mined

by open-pit methods and is beneficiated to raise the iron content to 58 p.c. Production is now at a rate of 50,000 tons a month and known reserves are estimated at 1,700,000 tons. On Texada Island, Texada Iron Mines Limited has been conducting a drilling program on its magnetite deposits and commenced the shipment of ore in the spring of 1952. Quatsino Copper-Gold Mines Limited has been drilling its Elk River property in the Quatsino area and has disclosed proven and probable reserves estimated at 922,000 tons.

It should be noted in connection with these developments that many deposits of magnetite and a few of hematite and limonite are known in British Columbia. The deposits vary widely in size, shape and attitude and close exploration is required to determine their contained tonnage. Among the larger known occurrences are those of Zeballos River, Iron Hill and Iron River, and Texada Island, all of which are well located with respect to coal deposits, transportation and important industrial centres.

British Columbia's production of the non-metallic minerals has increased in annual value from \$13,613,972 in 1945 to \$25,178,185 in 1951, the chief minerals in order of value of output in 1951 being coal, sand and gravel, cement, sulphur (content of sulphuric acid), stone and peat moss. The chief developments in the non-metallic minerals since the War are the discovery of chrysotile asbestos in the McDame Creek area in northern British Columbia and, more recently, the discovery of natural gas with distillate in the Peace River District, this being the first commercial discovery of natural gas with oil in the Province. Cassiar Asbestos Corporation Limited was formed in 1951 to acquire the asbestos deposits and a mill is under construction for the initial production of fibre. The oil discovery was made in Pacific Allied's Fort St. John No. 1 well, five miles south of Fort St. John and the oil was reached at a depth of 5,635 ft. As a result of this discovery exploration permits for oil and gas in the Province at June 15, 1952, covered 33,601,456 acres, principally in northeastern British Columbia but also in the New Westminster, Kootenay, Cariboo and Flathead districts.

Alberta.—The discovery of crude petroleum in the Leduc field in February 1947 has proved to be the most outstanding development in Alberta's industrial history. The succession of events that followed has focussed world-wide attention on the Province's potentialities as a major source of crude oil supply. They account also for the increase in the value of Alberta's mineral production from \$51,753,237 in 1945 to a record \$173,230,766 in 1951.

Aside from the oil developments (*see pp. 524-527*) the most important development has been the disclosure of huge reserves of natural gas, most of which has been found in the course of drilling for oil. Only to a limited extent so far has natural gas been made the primary objective of exploratory work and it is generally agreed that much larger quantities remain undiscovered. Most estimates of present reserves range as high as 10,000,000,000 Mcf., though some estimates are much higher.

The question of export of natural gas from Alberta has been under consideration for several years. It involves the problem of preserving a volume of gas sufficient for Alberta's needs for an extended period of years, and of proving a reserve in excess of this amount that will be large enough to justify the expenditures necessary to construct long-distance transmission lines. Recently the Alberta Government decided against the adoption of a policy permitting the general export of gas, the basis for the decision being that sufficient reserves have not been disclosed

to warrant such a policy at this time. However, the Government has granted the West Coast Transmission Company Limited permission to export a stipulated volume of gas from the Peace River area over a period of years and the Company plans to construct a pipe line from the area to Vancouver.

About 95 p.c. of Alberta's output of natural gas comes from five fields—Turner Valley, Viking-Kinsella, Leduc, Jumping Pound and Medicine Hat-Redcliff—all of which are connected by pipe line to local markets. Discoveries of commercial importance were made here and there throughout the Province in 1951, some of which resulted in important extensions to previously known fields, particularly around Medicine Hat, Provost and Bonneyville, while others resulted in the establishment of potential new gas areas. Many of the discoveries were capped pending market outlets. Production in 1951 reached a record 64,112,000 Mcf., compared with 58,604,000 Mcf. in 1950.

In some of the fields the natural gas has a relatively high content of hydrogen sulphide and this has led to the construction of plants by two companies to recover elemental sulphur from the gas in these fields. One of these, Royalite Oil Company Limited, has a \$350,000 sulphur plant at Turner Valley which will have a capacity of about 10,000 tons of elemental sulphur a year. Shell Oil Company of Canada Limited brought a plant of the same capacity into operation early in 1952 at Jumping Pound.

Besides being by far the leading Canadian producer of crude oil and natural gas, Alberta is well in the lead also in the production of coal and in 1951 contributed about 41 p.c. of the total Canadian output. About 60 p.c. of the output of 7,750,000 tons was bituminous and 39 p.c. sub-bituminous and lignite, mainly the former.

Strip mining of the coal is being practised to an increasing extent and at present about 40 p.c. of the output is so mined. The reduced labour requirements for this method are apparent from the fact that the average output from strip-mining operations per man-day in 1951 was 9 tons compared with 3.49 tons from underground mining. The continued development and improvement of the machinery used in strip mining has greatly increased the available coal for stripping and has increased the ratio of coal that may be stripped within economic limits.

In Alberta, as elsewhere in Canada, the coal industry has been continuing its efforts to improve the quality of its products. To this end, fluidized dryers for drying fine coal have been successfully introduced in the Province, with three such units in the Crowsnest area and one in the Mountain Park area. Pneumatic cleaning plants have been installed in the Coalspur and Drumheller areas, and in the Nordegg area a complete new plant has been constructed to clean all sizes retained on a quarter-inch screen. All the output of the plant is briquetted for railway locomotive and domestic use.

In value, crude petroleum, coal and natural gas, in that order, accounted for close to 95 p.c. of Alberta's mineral output in 1951 and cement, sand and gravel, and clay products for most of the remainder. The ordinary red-burning brick and structural and drain tile are produced from clays and shales obtained within the Province; the higher grade products such as sewer pipe, pottery and stoneware are made from Saskatchewan clays.

Saskatchewan.—Mining and related developments have also been active in Saskatchewan, particularly in connection with uranium and crude petroleum. As a result of the numerous discoveries of uranium ores, Saskatchewan bids strong to become a leading world source of these much-needed ores. The discoveries are in

three distinct areas. Two of these lie in the Lake Athabaska region in a belt that extends from the vicinity of Goldfields easterly along the north shore of the Lake and beyond to Charlebois Lake. Those near Goldfields cover an area of approximately 20 sq. miles, the other discoveries being in the vicinity of Sucker Bay, in the Middle Lake-Black Lake area, and in a fairly large area north of the east end of Black Lake to Spreckley Lake. The third area lies north of Lac La Ronge, which is linked to Prince Albert by a 175-mile gravel highway. Although Eldorado holds most of the ground being explored at present, a number of other companies are active in each of the areas. An estimated \$10,000,000 was spent in Saskatchewan in 1951 on the exploration and development of uranium deposits and indications are that expenditures in 1952 will be much higher.

The uranium developments are highlighted by the multi-million dollar construction program of the Crown-owned Eldorado Mining and Refining (1944) Limited at its Ace Property in the Goldfields area. The mill being erected is expected to enter production early in 1953 and, in addition to treating the ore from the property, is designed to serve as a custom plant for ores from other properties, one purpose of this being to encourage the development of uranium prospects. Use will be made of a new acid leaching process which gives a higher recovery and which was developed in the laboratories of the Federal Department of Mines and Technical Surveys.

Exploration for crude oil in the southern part of the Province has reached record levels and, in 1951 alone, close to \$20,000,000 was spent in the search for new sources of supply, an amount more than double that spent in 1950 on similar work. There was comparatively little activity in connection with natural gas in Saskatchewan until 1951 when four important discoveries were made in the west-central portion of the Province in the vicinities of Brock, Coleville, Dodsland and Elrose, and some wells have been added since. To encourage the search for natural gas the Provincial Government has announced that a year from the date a total of 200,000,000 Mcf. has been disclosed in these areas it will buy the production for delivery.

Saskatchewan is increasing steadily in importance as a producer of metals and minerals, the chief contributors to its mineral production being copper, zinc, gold, silver, coal, sodium sulphate, and sand and gravel. Much the greater part of its production from the value viewpoint comes from the large copper-zinc deposits of Hudson Bay Mining and Smelting Company Limited that straddle the Manitoba-Saskatchewan boundary. In 1951 the Company's production accounted for about 77 p.c. of the total value of Saskatchewan's mineral output which in that year reached a record \$50,907,504.

In the production of coal, the almost complete changeover during the past 15 years from underground operations to strip mining is a major development, particularly in view of the marked reduction in cost and of the close to fourfold increase in productivity per man-day. Both these factors are especially important under the competitive conditions arising from the crude oil and natural gas developments in Western Canada. In 1951 about 98 p.c. of the coal produced was from strip-mining operations. All the coal mined is lignite and most of it comes from the Estevan area in southeastern Saskatchewan. Nearly 65 p.c. of the output is shipped to Manitoba for domestic and industrial use. Recent estimates place the recoverable reserves of lignite at 12,000,000 tons.

Demand for Saskatchewan's output of sodium sulphate, particularly by the pulp and paper industry, has been outstripping supply despite a production increase of 45 p.c. in 1951 compared with 1950. In line with increased demand, prices at Saskatchewan plants moved upward on non-contract sales during the year. Exports showed an increase of 97 p.c. to 56,000 tons. Sources of the output are the large reserves of sodium sulphate that occur in highly concentrated brines and in alkali lakes in southwestern Saskatchewan, the only Canadian producer of the mineral.

The Province is also abundantly supplied with stoneware, fireclays, and ball-clays. However, its production of clay products is relatively small, amounting to only \$573,000 in 1951. There are various reasons for this, the main being that because of transportation costs the market is largely limited to the Prairie region. Stoneware clay is selectively mined in the Eastend area and is shipped to Medicine Hat, Alta., where, owing to the availability of cheap natural gas, it is used extensively to make a wide variety of stoneware articles, sewer pipe and pottery. The Provincial Government has undertaken an extensive program of exploration of the ball and other clay resources, in the hope that markets for such clays will develop in Eastern Canada and in the United States.

Manitoba.—Much of the post-war interest in mineral developments in Manitoba has been centred in the operations at Lynn Lake, 500 miles north of Winnipeg, where Sherritt Gordon Mines Limited has been busily engaged in preparing its large deposits of copper-nickel ore for production, which is expected to commence by the end of 1953. Development of the power sites on the Laurie River to supply hydro-electric energy to the Lynn Lake operations is well advanced and construction by the Canadian National Railways of the 147-mile railroad from Sherridon to Lynn Lake is progressing. The line is being built at an estimated cost of about \$15,000,000. Work on the design of the chemical metallurgical plant which is to be located at Fort Saskatchewan, 15 miles northeast of Edmonton, has been commenced and construction is scheduled to begin during the second quarter of 1952. The plant will be within easy reach of an adequate supply of water and natural gas. Present plans call for the treatment of 2,000 tons of ore a day with an estimated output of 8,500 tons of nickel and 4,500 tons of copper annually. Ore reserves in excess of 14,000,000 tons have been outlined. Meantime the Sherritt Gordon operations at Sherridon have come to an end and the mining plants, concentrator, and employees' houses are being moved to Lynn Lake.

The main development at the Flin Flon operations of Hudson Bay Mining and Smelting Company Limited has been the bringing of the new slag-fuming plant into continuous operation. This will enable the Company to increase its production of zinc to 65,000 tons a year from the present 50,000 tons and at the same time reduce the tonnage of ore mined, as the compensating production will come from the zinc plant residue. This Company in 1950 accounted for about 15 p.c. of Canada's output of zinc and about 15 p.c. of the output of copper and is also an important producer of cadmium, selenium, gold and silver, which are recovered as by-products. Aside from the slag-fuming plant, its facilities include a concentrator with a capacity of 6,300 tons a day, an electrolytic zinc refinery and a copper smelter. The Company ships its blister copper to Canadian Copper Refiners Limited, at Montreal East, for refining. It has been carrying out underground development work at its nearby Schist Lake mine and has a number of other

operations within a 20-mile radius of Flin Flon, including the Cuprus mine which is producing on a small scale, and several properties where exploratory work is proceeding.

There have been few major changes since the War in Manitoba's gold industry, one of the main developments being the entry into production of the Nor-Acme mine in the Snow Lake area in March 1949. The property is being operated on a lease basis by Howe Sound Exploration Company Limited, and is equipped with a 2,000-ton mill. This Company and San Antonio Gold Mines Limited, in the Rice Lake area, are the only quartz-gold producers in the Province at present, output from the Ogama-Rockland mine having ceased in June 1951. Gold production reached a peak of 191,725 oz t. in 1950, but declined to 162,257 oz t. in 1951. Over 78 p.c. of the 1951 output was from quartz gold mines, the remainder being recovered as a by-product of the base-metal operations at Flin Flon.

Little of interest has occurred since the War in connection with the large deposits of chromite in the Bird River area. Federal Government and other metallurgists have worked out methods of treating the ore that would be applicable in the event of an emergency, but would possibly not prove economical under present competitive conditions. The high iron content poses a difficult metallurgical problem. However, the deposits are not being overlooked and several companies have been active in the area.

Metal production accounted for about 75 p.c. of Manitoba's total 1951 output of minerals valued at \$28,398,000. The chief non-metallics produced, in order of value of output, were: cement, sand and gravel, clay products, stone, gypsum and salt.

Ontario.—Ontario has held first position in Canadian mineral production for close to half a century and still holds this lead by a wide margin. The value of its mineral production has increased from a lowly \$86,000,000 in 1932 to \$217,000,000 in 1945, and to a record \$437,000,000 in 1951.

Gold, nickel and copper accounted for over 71 p.c. of the total value of its mineral output in 1951 and metals as a whole for about 83 p.c. Sand and gravel, clay products, cement, gypsum, salt, quartz, mica and, since 1950, asbestos are the principal non-metallic minerals produced. Ontario produces all of Canada's output of nickel, the platinum metals, cobalt and nepheline syenite, most of the copper, gold, iron ore, salt and mica, and large percentages of several other metals and minerals.

Most of the major developments in the mineral industry since World War II have been in connection with iron-ore operations in the Steep Rock area, 140 miles west of Port Arthur, and in the Michipicoten area, and with nickel-copper operations in the Sudbury area. Of great importance also has been the establishment of an asbestos industry in the Matheson area in northern Ontario.

The importance of the iron-ore developments requires little comment, especially when it is realized that for many years prior to the War Ontario produced no iron ore and that at no time was the production large. The discovery of large deposits of hematite ore in the Steep Rock area has changed the picture completely, for Ontario now shows promise of becoming a major world source of iron ore.

The first shipments were made from the deposits in 1944, but at that time comparatively little was known of their extent or potentialities. Much of this knowledge has since been gained and, as the Steep Rock Iron Mines Limited

states in its recent annual report, it has become increasingly evident that the several ore deposits on its properties are extensive in area and that they are likely to persist to great depths. Ore potential has been estimated at as much as 500,000,000 tons per 1,000 feet of depth.

All the output from the deposits to date has come from open-pit operations at the Errington mine, but the Company is currently making a complete changeover to underground operations at this mine and is preparing its Hogarth mine for open-pit operations. Discussing the outlook, the Company expresses the view that full exploration of its deposits will justify production in excess of 10,000,000 long tons annually over a period of many decades. Practically all of the output, which amounted to 1,486,000 long tons in 1951, is exported to the United States.

Developments in the Michipicoten area also point to a substantial increase in iron-ore production in the years ahead. The Helen mine of Algoma Ore Properties Limited continues to be the only producer, but there are several other properties in the area available for development. Indicated reserves on some of these are in excess of 100,000,000 tons. The ore in the area is siderite and requires sintering to bring it up to commercial grade. The Helen ore is relatively high in manganese and accordingly is much in demand. About two-thirds of the output is exported to the United States and the remainder is used by Algoma Steel Corporation, the parent company. Production of sinter from the Helen mine increased from 504,534 long tons in 1945 to 1,188,842 long tons in 1951.

Meantime, the search for iron ore has spread to eastern and central Ontario, portions of which are underlain by iron-bearing rocks. The most advanced operation is at Marmora about 40 miles east of Peterborough where Bethlehem Steel Corporation has been preparing for production a magnetite deposit that was discovered in 1949 as a result of an airborne magnetometer survey conducted by the Geological Survey of Canada at the request of the Ontario Department of Mines. Production is scheduled to commence in 1954 at an initial rate of 400,000 tons of concentrate a year. The concentrate will be shipped to the Company's plant near Buffalo via Picton on Lake Ontario.

During the past ten years, the International Nickel Company of Canada Limited, long the source of over 80 p.c. of the world's output of nickel and a leading producer of copper, has been pushing forward its major program of changing over entirely to underground mining from the present open-pit and underground operations in the Sudbry area. This program is scheduled for completion by the end of 1953 and will enable the Company to hoist 13,000,000 tons of ore a year which is 5,200,000 more than the record tonnage hoisted from underground in 1951. In a related major development, the Company in 1951 brought into regular production the lower grade portion of its Creighton mine, employing new low-cost caving methods. This has involved the sinking of a shaft, construction of a crushing plant and concentrator, and construction of the pipe line to carry the resultant concentrate to Copper Cliff.

On the metallurgical side, the Company has completed the construction of a special type of smelting furnace which will use oxygen for the flash smelting of its copper concentrates in place of pulverized coal. This will permit not only a considerable reduction of cost but will also make possible a greater utilization of sulphur in the form of liquid sulphur dioxide from the smelter gases. The International

Nickel Company of Canada has also held first position as a producer of the platinum metals for the past several years and has spent in excess of \$100,000,000 since the War in conversion and expansion programs.

Falconbridge Nickel Mines Limited, Canada's only other producer of nickel, has also been expanding its operations. The Company obtains most of its copper-nickel ore from its Falconbridge mine and the remainder from its McKim mine, which was brought into production a few years ago. It is now preparing its Hardy mine for production at a 1,000-ton-per-day rate. Matte from the smelter at Falconbridge is shipped to the Company's refinery in Norway for recovery of the metals.

Rising costs of labour, supplies, equipment and services have had an adverse effect on Ontario's gold industry. However, production of the metal increased from 1,625,368 oz t. in 1945 to 2,445,902 oz t. in 1951, but the latter was slightly lower than in 1950 and was far below the peak production of 1940. In comparison with 1945, output from the Porcupine camp in 1951 increased by approximately 27 p.c.; from the Kirkland Lake camp by approximately 23 p.c.; Larder Lake, 226 p.c.; Matachewan, 19 p.c.; Patricia, 149 p.c.; and Thunder Bay, 177 p.c. Production of gold from base-metal operations totalled 40,640 oz t. in 1951.

Comparatively few new gold producers have been added to the list during the past six years and production of some of the established producers has been curtailed to a varying degree. Federal Government cost-aid, which came into effect at the commencement of 1948, has been a stabilizing influence and by Dec. 31, 1951, had reached a total of \$19,140,486 for Ontario. This assistance has been of chief benefit, of course, to the higher cost and marginal mines.

Of special interest is the recent activity in the Cobalt-Gowganda area both in relation to silver and cobalt. This once-famous area, which in 1911, the peak year, recorded a silver output of 31,507,791 oz t., appeared for a time to have faded from the picture as an important contributor to Ontario's mineral output. But the urgent need for cobalt in post-war industry and for defence purposes, coupled with the rising price of silver, caused attention to turn again to the camp and there has been a steady increase in activity since 1949. Production of silver from the camp increased from 476,335 oz t. in 1945 to approximately 4,000,000 oz t. in 1951.

The production of cobalt in the area is closely linked with that of silver. Cobalt became one of the scarcest of metals in 1951 owing to its increasing use in jet engine alloys, armour plating, as a binder in the manufacture of cemented carbide tools, in high operating temperature engines and in permanent reagents for electronic use. As a means of stimulating production, the Federal Government raised substantially the price of cobalt contained in cobalt ores. Cobalt occurs in minor amounts in the copper-nickel ores of the Sudbury area and is recovered from the residues of the electrolytic refining of nickel.

The addition of asbestos to the list of non-metallic minerals produced in the Province is a major post-war development. The main discoveries of this mineral have been in the Matheson area and exploratory work indicates that they are extensive. Output commenced in 1950 and in 1951, the first full year of operation, amounted to 26,100 tons. The asbestos is of a type well suited to the manufacture of asbestos cement now in great demand in Canada.

Nepheline syenite, salt, quartz, gypsum, mica, fluorspar, clay products, cement, lime, stone and crude petroleum round out the list of minerals produced in Ontario. The Province has the distinction of being the only present-known source of nepheline

syenite outside of the U.S.S.R. The output in Ontario is obtained from extensive deposits in Peterborough County. Most of Ontario's large output of salt is used to supply its expanding chemical industries and is obtained from wells drilled 800 to 1,500 ft. below the surface at Goderich, Sarnia, Warwick and Sandwich.

Quebec.—Mining in Quebec has been forging ahead at a feverish pace during the past number of years. Mineral production has climbed in value from \$86,313,491 in 1940 to \$91,518,120 in 1945 and to an all-time high of \$250,000,000 in 1951. In value the output in 1951 was almost evenly divided between the metallic and the non-metallic minerals, the latter being in the lead. Quebec was an important producer of the non-metallic minerals long before it had acquired any prominence as a producer of metals. In fact, metal output was relatively small prior to 1927, when the Noranda mine was brought into production, but has increased from a value of \$13,914,000 in 1932 to a record \$120,201,000 in 1951. However the indications are that, in value of output, the metals will soon overtake the non-metallic minerals mainly as a result of the iron-ore developments in the Quebec-Labrador region. Production from these iron-ore deposits is scheduled to commence in 1954. At present, asbestos is the chief single contributor to Quebec's mineral output.

The record of mining expansion in Quebec since the War is largely a record of pace-setting developments in connection with iron ore and titanium. These have gained an international prominence and thus stand out in relation to the others, several of which are also of importance.

The story of the iron-ore developments is by now fairly familiar to most Canadians. The discovery of the Sawyer Lake deposit in 1937 and of that at Burnt Creek in 1938 marked a major turning point in Quebec's mining history. Close to 420,000,000 tons of hematite ore has been proved to date in the deposits that have been explored and much ground still remains to be explored. Already over \$50,000,000 has been spent in preparing the deposits for production and a further estimated \$150,000,000 will be spent to bring the work to completion. Construction of the 360-mile railway has been started at both ends, and will be about half completed by the end of 1952. Work is proceeding on two hydro-electric power sites, one on the Menihek River about 30 miles south of the deposits and the other on Marguerite River about 20 miles north of the ore terminus. Altogether about 3,800 men are employed on the various construction and other projects, 2,300 of whom are engaged on the railroad construction.

Initially, production from the deposits will be at an annual rate of 10,000,000 tons which may eventually be extended to 20,000,000 tons. In any case there will be a large surplus of ore beyond Canadian needs. The marketing of this surplus is not likely to prove difficult in view of the steadily increasing demand for iron ore throughout the world and of the rapid rate of depletion of the high-grade ore in the Mesabi Range.

In the meantime the production of titanium ore in Quebec has become an established industry. In 1950, the first year of operation, 100,000 tons were shipped and in 1951 shipments increased to 372,000 tons. The deposits, discovered in 1946, are in the Allard Lake area 27 miles north of Havre St. Pierre on the north shore of the Gulf of St. Lawrence and, so far as is known, are the largest of their kind in the world. They are owned by Quebec Iron and Titanium Corporation which ships the ore to its smelter at Sorel, Que., where it is treated to produce low-carbon iron and a titanium dioxide slag. The iron is desulphurized, cast into ingots,

and is sold as high-grade iron. At present only one furnace is in operation in the plant but two others are nearing completion and two more are to be built. The smelter, when completed, will have a rated daily capacity of 500 tons of iron and 700 tons of titanium dioxide slag.

Not so many years ago Noranda Mines Limited accounted for all but a small part of the output of base metals in Quebec. However, a few other mines in that section began contributing and then, with the sharp rise in the prices of copper and zinc, more followed, each in turn expanding its operations. The high prices also caused attention to turn to the Eastern Townships and to other areas that had remained largely inactive for years.

Recently, large deposits of zinc and silver have been disclosed at the Barvue mine east of Amos in Barraute township. Close to 18,000,000 tons of zinc-silver ore has been outlined at the property to a depth of 700 ft. and a mill capable of handling over 5,000 tons of ore a day is scheduled to enter production by the middle of 1952. This development appears to be shaping up as one of the largest zinc operations in the country, with an anticipated output of more than 35,000 tons of zinc annually when full operation is reached.

A number of other properties have also appeared in the picture: the East Sullivan and Quemont mines in western Quebec, which entered production in 1949; the Moulton Hill and Suffield mines in the Eastern Townships, both of which are operated by Ascot Metals Corporation Limited; the Anacon mine about 70 miles west of Quebec city; and Noranda's copper property in Gaspé Peninsula which its subsidiary, Gaspé Copper Mines Limited, is now developing toward production. The latter, located across the St. Lawrence from the port of Seven Islands, appears also to be developing into a major enterprise. The grade of the ore is relatively low but the reserves are presently estimated to be in excess of 70,000,000 tons, which would be sufficient to maintain operation for many years. Plans call for production of 5,000 tons of ore daily, commencing in about five years; when in full production this property will increase Quebec's copper output by about 25,000 tons a year. An estimated \$8,000,000 will be required to bring the mine into production.

The revival of interest in the Chibougamau area, 210 miles northeast of Noranda, is also of considerable significance. Earlier development of this area was handicapped by lack of suitable transportation and low metal prices, but these obstacles have been overcome and there is also reasonable assurance of a supply of hydro-electric power needed for the various operations. Several companies are engaged in exploring copper-gold deposits here and there throughout the area and work on some of the prospects is sufficiently advanced to warrant consideration of mill construction.

What the future may bring in the way of further important discoveries will depend largely upon the continuance or otherwise of the present demand. The consideration being given currently to the erection of a zinc refinery in the Province is indicative of the optimism that prevails in reference to the outlook for the base metals. One of the largest copper refineries in the British Commonwealth and Empire is located at Montreal East, but it is only recently that the production of zinc has reached the point where a zinc refinery seems warranted.

In terms of value of output, and exclusive of the fuels, Quebec in 1951 accounted for approximately half of Canada's production of the non-metallic minerals, and asbestos in turn accounted for 58 p.c. of the Province's output of these minerals. Quebec's output of 941,268 tons of asbestos valued at \$75,000,000 was about 95 p.c. of the Canadian total for 1951 and about 70 p.c. of the world total.

Quebec's asbestos industry, located in the Eastern Townships, has shown great expansion since the War as a result of widespread demand. Present plans call for extensive expenditures for the enlargement of plants and for the exploration and development of deposits. Canadian Johns-Manville Company Limited, the leading producer, is rebuilding the mill at its Jeffrey mine at an estimated cost of \$14,000,000; Asbestos Corporation is developing its new Normandie mine in the Black Lake area toward production in a program that will ultimately cost in the neighbourhood of \$10,000,000; and Johnson's Company also has a large expansion program on hand, including plans for the construction of a new mill at its Black Lake property at an estimated cost of \$16,000,000.

Few changes of outstanding importance have occurred since World War II in reference to the other industrial minerals produced in Quebec. The demand for most of these minerals has been exceptionally strong, particularly for cement, clay products, sand and gravel, and stone of which Quebec is a leading Canadian producer. Most plants have been operating at or near capacity.

New Brunswick.—Although the value of mineral production in New Brunswick increased from \$4,182,100 in 1945 to \$10,282,408 in 1951, few changes of outstanding importance have occurred since the War in the general mining picture. Coal mining has long been the core of the Province's mineral industry, and coal the principal mineral product. Output comes from the Minto-Chipman field in the south-central part of the Province, the field's single seam lying close to the surface over a large area.

The output of coal has been rising steadily during the past few years, reaching a new high of 650,000 tons in 1951. Much of this has been due to the increased use of heavy strip-mining equipment and in 1951 about 68 p.c. of the coal produced was strip mined. Over 90 p.c. of the total output is used locally by the railways and other industry.

Structural materials, including clay products and gypsum, peat moss, natural gas, and a minor output of crude petroleum, comprise the remainder of the Province's mineral output. Gypsum is produced in the Hillsborough area of Albert County where Canadian Gypsum Company Limited, the only producer, operates two quarries and a mine and manufactures wallboard, gypsum lath, plaster and allied products. The Maritime Provinces realized their first production of cement when the new plant of Maritime Cement Company Limited, a subsidiary of Canada Cement Company Limited, entered production at Havelock in New Brunswick early in 1952. The plant has a capacity of 800,000 bbl. a year.

Large areas of granite of suitable grain and colour for both structural and monumental purposes are found in the Province. Red granite is produced in the St. George and Bathurst districts, black granite in the Bocabec district, and grey and bluish-grey granite in the Hampstead area.

For a number of years natural gas and crude petroleum have been produced from the Stony Creek field in the southeastern part of the Province, and Moncton, Hillsborough, and other localities in Albert and Westmorland Counties obtain their supplies of natural gas from this source. Production of these two fuels has declined steadily, however, during the past few years.

Considerable interest has been shown recently in some of the base-metal occurrences and over 20 companies are engaged in the search for these metals. Most of the activity has been in Gloucester and Restigouche Counties, and particularly in the Rocky Brook-Millstream field where there are known occurrences of copper, lead, zinc and silver.

Nova Scotia.—The marked growth of interest and activity in the various fields of mineral endeavour across Canada has been reflected within the mineral industry in Nova Scotia in the extensive mechanization and modernization under way in the mining of coal, the principal mineral product, and in the expansion in production of industrial minerals, particularly gypsum and barytes. Interest has also been revived in the Province's base-metal deposits which have as yet remained largely undeveloped. Mineral production as a whole increased in value from \$32,220,659 in 1945 to \$59,387,855 in 1951, coal accounting for over 83 p.c. of the value of output in 1951.

Coal mining has long been a major industry in the Province and has been carried on for over 200 years. The main fields are those at Sydney and Inverness in Cape Breton Island, and at Pictou and Cumberland on the mainland. The coal comes from Pennsylvanian strata and is all of bituminous rank. Much of it is suitable for the production of coke and gas and, in addition, is a good steam coal. Production ordinarily supplies the railroads of the area, the local steel industry and the domestic market, as well as part of the fuel requirements of the Province of Quebec.

Mechanization of the coal mines has proceeded rapidly, the chief mines being now fully mechanized, except in certain cases, for loading coal into mine cars. The Dominion Steel and Coal Corporation Limited has developed a coal-cutting and loading machine designed to dig and load 500 tons of coal in eight hours. This Company is carrying out a \$7,000,000 mechanization and mine development program. Bras d'Or Company Limited, which was the first company in the Province to complete the mechanization of its workings, has installed a coal-cleaning plant, the only one of its kind in Canada.

Extensive research on coal is being carried out in Nova Scotia by the Federal and Provincial Governments. A thorough scientific study of coal has been undertaken as well as studies of rope haulage and methods of rope socketing in the coal mines.

Industrial minerals are playing an increasingly important role in the Province's mineral production. Nova Scotia is the leading Canadian producer of barytes and gypsum, producing in 1951 over 98 p.c. and 84 p.c., respectively, of the entire Canadian output of these minerals. Canadian Industrial Minerals Limited accounts for practically all of the barytes produced in the Province from its deposit at Walton, Hants County. Production consists of crude barytes for the chemical trade and ground barytes for industrial filler and drilling mud. Ground white barytes will be added to the output upon completion of the mill of Maritime Barytes Limited

on its deposit at Brookfield in Colchester County. The Province's output of barytes in 1951 totalled 83,270 short tons valued at \$813,640 compared with the peak production of 125,760 short tons valued at \$1,353,705 in 1947.

Gypsum is produced in Victoria County on Cape Breton Island and in Hants County on the mainland where Canadian Gypsum Company Limited, the largest Canadian producer, operates large quarries at Wentworth near Windsor. Production in 1951 totalled 2,829,336 short tons valued at \$3,926,465. Approximately 5,000 tons of the Province's output is processed locally and the remainder is exported in crude form, mainly to the United States.

Nova Scotia is next to Ontario in the production of salt and its output consists of both mined rock salt and fine vacuum salt. The only salt mine in Canada is operated at Malagash in Cumberland County by Malagash Salt Company Limited. The mined rock salt is sold chiefly as a de-icing salt for roads and railways. Fine salt from vacuum pan evaporators is produced near Amherst by Dominion Salt Company Limited from a brine obtained from massive salt beds which come within 860 feet of the surface at this point. Salt production reached a peak of 125,236 short tons valued at \$1,223,253 in 1951.

Other industrial minerals produced include granite, sandstone, limestone, dolomite, diatomite, silica rock and clay products.

There is no base metal production at present in Nova Scotia, but Mindamar Metals Corporation Limited is preparing the old copper-lead-zinc Stirling mine in Richmond County for production in 1952. Geophysical surveys and extensive diamond drilling are under way on lead occurrences at Smithfield in Colchester County, and at McAdam Lake in Cape Breton County, and copper and lead occurrences in other parts of the Province are being investigated.

Newfoundland.*—Comparatively little is as yet known of what Newfoundland has to offer in the way of mineral wealth. Until entry into Confederation in 1949, only a minimum of exploration had been carried on and whole areas remained unexplored despite the fact that operations at the Province's only two metal-producing properties, the zinc-lead-copper mine of Buchans Mining Company Limited and the Bell Island iron mines of Dominion Wabana Ore Limited, have proven highly successful over the past several years.

Exploratory activity is now fairly widespread; it is greatest in central Newfoundland and in the region extending through to Notre Dame Bay on the east coast. Falconbridge Nickel Mines Limited, with headquarters at Gull Lake in the centre of the Island, where it plans to sink a shaft on a copper property, is continuing the exploration of its copper holdings at Tilt Cove and at Rambler and Springdale. Buchans Mining Company Limited is carrying out extensive drilling on its concessions in the central and southwestern sections of the Province. In Notre Dame Bay, Pilley's Island Copper Pyrites Limited is continuing development work on its holdings on Pilley's Island. Over on the west coast, Independent Mining Corporation is re-examining the old York Harbour copper-zinc mine on Bay of Islands, while Cape Copper Company Limited is continuing to drill its holdings at Gregory River. North of Port au Port interesting results have been obtained on an asbestos property at Bluffhead.

* For developments in the Quebec-Labrador iron-ore field see p. 487.

Production of iron ore from the Wabana mines reached a peak of 1,788,000 tons in 1951. Dominion Wabana Ore Limited is a subsidiary of Dominion Steel and Coal Corporation Limited and approximately 50 p.c. of its production is shipped to that Company's steel mills at Sydney, N.S. The high sulphur and phosphorus content of the ore prohibits its use in other Canadian steel mills and the remaining production goes to the United Kingdom, western Germany and the United States. The Company, in 1950, contracted to supply the United Kingdom with 1,200,000 tons and Germany with 560,000 tons each year for five years until 1956, and to meet these commitments a \$6,000,000 expansion and modernization program has been undertaken which will double the Wabana productive capacity by late 1952. It involves interconnecting the Company's four mines and hoisting ore through one slope only, by means of a continuous belt-conveyor system.

Buchans Mining Company Limited is busily engaged in developing its new Rothermere orebodies on its property five miles north of Red Indian Lake in central Newfoundland. Output, which is scheduled for late in 1952, is expected to add considerably to the Company's production, which in 1951 amounted to 324,000 tons and from which 58,910 tons of zinc concentrate, 28,070 tons of lead concentrate, and 12,424 tons of copper concentrate were produced.

Newfoundland has extensive reserves of fluorspar and accounts for almost 93 p.c. of Canadian production. All the commercial fluorspar veins occur in the vicinity of St. Lawrence, a town on the south coast. Over 24 veins have been located, and fluorite mineralization is known to extend as far as three miles longitudinally and to depths of over 500 feet with no significant changes being noted in grade and width.

Since the initial development of the deposits in 1932, output has increased steadily, multiplying tenfold since 1937 to over 80,654 short tons in 1951. St. Lawrence Corporation Limited, by far the larger of the two producers, turns out one of the highest grade concentrates in the world, selling its output to the steel and chemical industries of Canada and United States. Remaining production comes from Newfoundland Fluorspar Limited, a subsidiary of Aluminum Company of Canada Limited, and is used mainly in the manufacture of aluminum.

Other mineral production is confined to limestone and structural materials, including clay products. Limestone is quarried at Aguathana on the north side of St. George's Bay. Part of the production is shipped to Sydney, N.S., where it is used as a flux in the steel industry and part is used locally for building and agricultural purposes. Brick clay deposits are worked on Trinity Bay, while granite is quarried on the south coast at La Poile and Rose Blanche. There are numerous occurrences of marble along the west coast and in the region of White Bay on the east coast where it is quarried at Purbeck Cove and Sops Arm.

Gypsum suitable for quarrying occurs along the west coast and in 1951 the Provincial Government, as part of its development program, erected two factories at Humbermouth for the production of gypsum plaster and plaster board and lath, the raw material to come from a deposit at St. George's Bay. The plaster plant has a capacity of 200 tons daily while the wallboard and plaster lath plant is capable of turning out 250,000 sq. ft. of wallboard a day or 285,000 sq. ft. of plaster lath.

Yukon Territory.—Interest in mining in Yukon has turned sharply upwards and since 1947, when production from the deposits commenced, the Territory has been witnessing a new wave of mineral exploration and development. The

Noranda Mines Limited and Hudson Bay Mining and Smelting Company Limited have been playing important roles in this development, particularly in connection with the exploration of lead-zinc deposits.

For a number of years prior to 1947, mining had been decreasing rapidly and, although placer gold operations in the Klondike area were maintained at a high level, lack of suitable transportation and of a supply of hydro-electric energy had all but discouraged the outlay of capital in the exploration and development of properties in other areas. The success of operations in the Mayo area pointed up the need for a highway to connect Whitehorse and Mayo, the construction of which was completed by the Federal Government a few years ago. Thus, improved transportation, together with power prospects contingent upon the development of a power site on the Mayo River which is scheduled for completion before the end of 1952, and high metal prices have provided much of the incentive needed to encourage capital expenditures in the search for and development of mineral deposits.

At present, the Mayo area is exceptionally active and a number of companies are engaged in appraising the mine-making possibilities of their holdings. From the commencement of its operations until the end of 1951, United Keno Hill had produced concentrates containing about 39,000,000 lb. of lead, 16,000,000 lb. of zinc, and close to 11,000,000 oz t. of silver. The Hector mine has been the principal source of ore, but the Company has been carrying out considerable preproduction development on its Onek mine about four miles east of the Hector and plans to build a 300-ton mill on this property. The silver-lead-zinc concentrates are shipped to Trail, B.C., for smelting and recovery of the three metals and of cadmium which occurs in association with the ores. United Keno Hill accounts for practically all the production from the area but several other properties show promise.

Although the glamorous days of the far-famed Klondike rush have long since passed, placer gold operations in Yukon Territory seem likely to continue. Recent estimates place Yukon Consolidated Gold Corporation gravel reserves well in excess of 100,000,000 cu. yd., sufficient for many years of operation on the present scale. In 1951 it had seven dredges in operation compared with eight in the previous year, which accounts for the decline in the value of its gold output from \$2,540,000 in 1950 to \$1,907,000 in 1951. The Company is by far the largest producer of placer gold in the Territory.

Coal is the only other mineral produced in Yukon where the output is small, amounting to only 3,470 tons in 1951, all of it being from the Carmacks area. However, some shipments of wolframite, an ore of tungsten, are expected to be made during the summer of 1952 by Yukon Tungsten Corporation, which acquired ground in 1951 along the Alaska Highway about five miles north of Mile 701.

Northwest Territories.—Considering that as recently as 1932 the value of mineral production from this vast region with a land area of 1,253,438 sq. miles was only slightly more than \$21,000, the increase in the value of output to \$8,229,681 in 1951 is truly impressive, the latter amount being exclusive of pitchblende products, which are not reported. Aside from these products, the mineral output consists entirely of gold, crude petroleum, silver and natural gas, the value of the gold output in 1951 being about 94 p.c. of the total. It is interesting to note that the value of mineral production in the Northwest Territories in 1945 was only \$471,000, exclusive of pitchblende products.

Although early explorers reported the occurrence of minerals in various sections of the Northwest Territories, it was not until 1920 when crude oil was discovered at Norman Wells, about 100 miles west of Great Bear Lake, that much serious attention was given to the possibilities of the Territories as a source of mineral wealth. This development aroused considerable interest for a time but little of importance happened until 1930 when Gilbert La Bine reported the discovery of pitchblende deposits at Echo Bay on the east shore of Great Bear Lake. This historic event actually gave mining its start in the Territories and, along with the advent of the aeroplane, paved the way for the developments that have followed.

Attention soon turned to gold and before long various discoveries of this metal were made in the Yellowknife area. The first gold brick was poured in 1938 and gold mining has since become a well-established industry in the area, being the main source of livelihood for the 2,724 persons of Yellowknife Settlement. By 1945 production of gold from the area had reached an annual value of \$333,218, and in 1951 had increased to \$7,755,119. Giant Yellowknife Gold Mines Limited with an output of 107,000 oz t. in 1951, is by far the largest producer, the others being Con, Rycon, Negus and Discovery Yellowknife.

Exploratory interest in the Territories is at present concentrated on the search for base metals, petroleum, natural gas and uranium. In connection with the base metals, the search is centred in the Pine Point area on the south shore of Great Slave Lake where the Consolidated Mining and Smelting Company of Canada Limited has been doing exploratory drilling on a large zinc-lead deposit to determine whether there is sufficient ore to warrant further development of the property. There has been considerable prospecting for base metals also in the O'Connor Lake area where American Yellowknife Gold Mines Limited has outlined a medium-sized deposit reported to contain 15 p.c. combined lead and zinc.

The present interest in crude petroleum constitutes a spreading of activity from Alberta northward. Most of the activity is in the Fort Providence area west of Great Slave Lake where some test holes have been drilled and the drilling of others is planned. Some exploratory work is in progress between longitudes 119° and 122° along the Alberta-Northwest Territories boundary and there should be considerable activity in both areas in 1952 as applications have been made for permits to explore several million acres of territory.

The Norman Wells area has been comparatively quiet since World War II and production has been maintained only at a level sufficient to meet the requirements of the various mining operations. Output from wells in the area in 1951 amounted to 215,000 bbl.

Production of uranium ore at the property of the Crown-owned Eldorado Mining and Refining (1944) Limited, at Fort Radium on Echo Bay, which was interrupted by destruction of the mill by fire in November 1951, was resumed in May 1952 with the completion of a new gravity mill and crushing plant. The new leaching unit and related acid plant, which will effect a marked increase in the recovery of uranium, were completed at the same time.

Much of the Northwest Territories still remains unexplored and its outlook as a potential producer of minerals would be difficult to appraise. Most of the mainland portion is underlain by rocks of the Canadian Shield that have proved so highly productive in other parts of Canada. However, except along the western fringes, relatively little geological work has been done in the Shield area. In this connection it should be noted that the Geological Survey of Canada is undertaking a

large project in 1952 that includes the mapping of an approximate 100,000-square-mile-portion of the Shield for about 100 miles from Chesterfield Inlet southwesterly to Selwyn Lake on the southern boundary of Northwest Territories. This is being done to provide a preliminary survey of the mineral potentialities of the area.

Conclusion.—At the time of writing (June 1952), the tempo of mining activity throughout Canada continues to increase and new developments are occurring here and there in the industry—a group of five oil firms has acquired a 50,000-acre Crown permit in the bituminous sands area of northeastern Alberta and is to start a core-drilling campaign shortly; Saskatchewan's third oil-strike in 1952 has been made in the Hoosier area about six miles east of the Alberta border; a staking rush has started in an area 20 miles south of Sudbury; milling of lead-zinc ore is to commence shortly at a property in northern Ontario; and a new gold mine has entered production in western Quebec. Week by week news-making events are occurring and, though the prices of some of the metals have receded from the high levels reached in 1951, there is little indication of a general decline.

Much of the present activity in the industry is the outcome of huge capital outlays in plant, railway, power development and other constructional projects, the Kitimat project and the Quebec-Labrador iron ore development being two outstanding examples. Such expenditures are characteristic of a rapidly growing industry and, though there may be a considerable scaling down from current levels when the present projects are completed, there seems to be every assurance that the flow of funds into mineral development will continue at a high level for some time to come. Quite apart from their beneficial influence on the economy of the country, the accomplishments of the past few years have emphasized the fact that Canada has much greater potentialities as a mineral producer than was ever before realized.

Section 2.—Government Aid to the Mining Industry*

Subsection 1.—Federal Government Aid

The Department of Mines and Technical Surveys.—The Federal Department of Mines and Technical Surveys, which came into being on Jan. 20, 1950, as a result of a departmental reorganization at Ottawa, continues the services, but in larger measure, rendered to the mining industry by the former Department of Mines and Resources. The Department has five branches—Geological Survey of Canada, Mines Branch, Surveys and Mapping Branch, Dominion Observatories, and Geographical Branch.

Geological Survey.—The chief function of the Geological Survey is to map and report on the geology of Canada. It carries out geological studies in the field and office to promote the discovery and development of mineral resources and underground water resources; contributes geological information as an aid in the construction of such public works as dams, bridges, tunnels, foundations, etc.; and makes mineralogical and palaeontological studies in the field and office that assist in promoting the study and development of mineral resources; collects minerals and materials for study, exhibition and distribution; and makes geophysical

* Revised under the direction of Marc Boyer, Deputy Minister, in the Editorial and Information Division, Department of Mines and Technical Surveys, Ottawa.

surveys. The types of reports issued by the Geological Survey comprise the following: memoirs with fairly complete descriptive accounts of the geology of particular areas and accompanied, as a rule, by geological maps; bulletins dealing with problems rather than areas; papers issued as soon as possible after the close of the field season, treating separately of each area and summarizing the information acquired; and, the Economic Geology Series reports, dealing in a comprehensive way with mineral deposits of a particular type. Coloured geological maps are issued on various scales from one inch to a few hundred feet to one inch to eight or more miles, the common standard scales being one inch to one mile and one inch to four miles. Preliminary blue-line prints, on which the geology is shown in pattern, are issued shortly after the field season ends of those areas where the search for metals or minerals is active.

Since its establishment in 1842, the Survey has mapped over 30 p.c. of the total area of Canada. In 1952, 78 parties were assigned to field work compared with 88 in 1951. The work undertaken in 1952 included the continued study of metalliferous and potentially metalliferous areas of Canada; the investigation of the Quebec-Labrador iron belt; the geological air reconnaissance of 100,000 sq. miles of territory lying west of Hudson Bay between latitudes 60° and 64°; the mapping of areas favourable to the accumulation of oil and gas in Western Canada and in Ontario; and the examination of occurrences of radioactive minerals, particularly in northern Saskatchewan.

The Regional Geology Division carries out geological surveys of the bedrock formations and associated ores and economic materials of Canada by means of annual programs of systematic investigations and geological mapping, mainly of areas that have been mapped topographically.

The Palæontology Division carries out palæontological and stratigraphical investigations and studies that are of great importance in geological mapping, interpretation of structures, and exploration for natural fuels and minerals.

The Mineralogy Division prepares and distributes mineral and rock collections for use of prospectors and educational institutions, organizes and maintains a systematic collection of minerals for reference and exchange, and identifies mineral specimens sent in by the public.

The Radioactivity Resources Division is concerned with the field and laboratory investigation of Canadian resources of radioactive raw materials, and maintains free testing and advisory services for uranium prospectors. As agent of the Atomic Energy Control Board, the Division receives the results of analyses for uranium and thorium and reports on the development of radioactive mineral deposits, which information is incorporated in a confidential inventory.

The Pleistocene and Engineering Geology Division is engaged in the study of the unconsolidated materials which mantle the bedrock throughout the greater part of Canada. The geological study of these materials is a prerequisite for many types of engineering and agricultural projects.

The Fuels Resources Division is engaged in the technical study and interpretation of rock cuttings from wells drilled for oil and natural gas with the view to directing exploration for these minerals to localities offering the greatest promise of production. The Division also investigates the geology of coal deposits as a basis for estimating Canada's coal reserves, and conducts research into the microscopic character of individual seams, thus providing information of aid in predicting the type of coal which may be expected in advance of actual workings.

Mines Branch.—The Mines Branch is primarily concerned with the technological problems of the mineral industry and maintains well-equipped ore testing, mineral dressing, fuel research, ceramic, radioactivity, industrial minerals and physical metallurgy laboratories to handle these problems.

The Mineral Dressing and Process Metallurgy Division assists new mining ventures by aid in determining the most efficient method of recovering metal contained in ore, assists mine operators in solving problems in milling practice, and develops new procedures to extend the use of mineral resources. Its laboratory facilities are utilized at various times by mining companies for working out some particular process, employing their own staff with the co-operation and guidance of the Division staff.

The Radioactivity Division is concerned with investigations of radioactive ores, in particular with the development and application of methods whereby marketable concentrates may be produced from individual uranium ores. The primary functions of the Division's technical services and laboratory facilities are to help bring new properties into production by determining methods suitable for treatment of particular ores and to encourage the search for uranium deposits. Extensive experimental and development work is conducted on the treatment of ores and products from the properties of the Crown-owned Eldorado Mining and Refining (1944) Limited.

The Industrial Minerals Division is concerned with matters relating to the development and processing of Canada's industrial minerals, including water used for industrial purposes and studies of ores of such alloying metals as cobalt, manganese, molybdenum, tungsten and chromium. To encourage and assist in the development of domestic resources, the Division makes field studies of deposits of industrial minerals, examines industrial processes utilizing them, and carries out research into methods of beneficiating minerals from deposits of marginal and sub-marginal quality to bring them up to the standards demanded by modern industry.

The Fuels Division is engaged in the study of the type, quality and uses of all fuels and of production methods, largely as a means of devising cheaper and more efficient methods of mining, preparation, processing and utilization of coals. Work in the field or in its laboratories includes, for example: the investigation of methods of mining, particularly of rock pressures in relation to the economic mining of coal at depth, and of coal preparation, as, for instance, the cleaning and utilization of the low grade finer sizes of bituminous coal which predominate in Canadian mining operations; the development of a coal-fired gas-turbine; investigations into the making of coke for foundry and other metallurgical uses and into the increased use of Canadian coal in domestic stokers; high-pressure hydrogenation tests on coal for the production of synthetic liquid fuel, and hydrogenation as applied to the refining of oil from bituminous sands of Alberta; and analyses of crude oils and natural-gas products.

There is much inter-relation of federal and provincial activities in regard to fuels. A current illustration of this is the establishment of a joint federal and Nova Scotia office and laboratory at Sydney, N.S., to investigate the nature and extent of the coal seams in Cape Breton; another concerns the pilot-plant project, recently terminated, for separating bitumen from Alberta bituminous sands by a method devised in the Mines Branch.

The Physical Metallurgy Division aids in the growth of the metal industries through the development of new alloys, new manufacturing techniques, and new applications; in the improvement of present practices in metal fabrication industries; and in the more effective use of metallic products by the consumer. Close co-operation is maintained with the National Research Council, particularly in the metallurgical work associated with the development of the atomic energy project at Chalk River, Ont.

The Mineral Resources Division—through the wealth of data amassed over many years on mineral properties and operating mines, mineral exploration and development, processing and production, new research development, uses and marketing of minerals and their products, world sources of minerals and new discoveries, and on mining laws and taxation—provides a general mineral information service that is freely used by government departments, mining and allied industries, and others interested in mining or its significance in the Canadian economy. A mineral resources index inventory has been established of all known occurrences and mines, both active and potential, special attention being given to occurrences of those minerals in which Canada is deficient.

The Division makes specific economic studies of various phases of the mining industry. It gives technical advice as required for the administration of the Emergency Gold Mining Assistance Act and prepares reports, on request, to aid the administration also of such matters as: tax exemptions on new mining properties; tax deductions as an encouragement to prospecting for base metals, other minerals and petroleum; and tax allowances for the drilling of deep-test wells for oil in unproven fields.

Surveys and Mapping Branch.—The Surveys and Mapping Branch provides the base maps required for use in the development of Canada's natural resources, produces and distributes all Canadian aids to navigation, is responsible for all legal surveys of federal lands, and provides a national system of levelling and precision surveys for use as geodetic control by federal, provincial and private agencies.

New developments in mapping equipment and new techniques in mapping practice make it possible to increase the output of maps and charts, and to cover areas, such as northern Yukon Territory where lack of transport facilities and shortness of field season previously had made the cost of mapping prohibitive.

The Geodetic Survey provides the original surveys which form the framework or basic control for mapping throughout Canada and for engineering and surveying projects related to natural resources development. The control is provided by establishing survey stations at fairly regular intervals across Canada. These stations are marked by permanent monuments whose latitudes, longitudes and elevations above mean sea level are determined with a high degree of accuracy.

The determination of geographical position by astronomical observations for mapping purposes in northern areas is being superseded by Shoran trilateration in which the recently developed adaptation of radar is meeting with success. During the 1951 and 1952 field seasons geodetic control was thus extended to the Far North many years in advance of the time that would have been required by conventional methods.

The Topographical Survey provides base topographical maps that show all significant natural and artificial features fundamental to the study and economic development of mineral and other natural resources. The Topographical Mapping

Section is responsible for field surveys; and the Air Survey Section plots and produces maps from aerial photographs, with control provided by field surveys. The Map Editing Section and Compilation Section are responsible, respectively, for map editing and finishing, and mathematical computations. The National Air Photographic Library is responsible for indexing, preserving and distributing prints for all air photography done by or for the Federal Government, and the Survey administrators and provides funds for the Canadian Board on Geographic Names.

In 1952, 57 parties including 14 Army Survey Establishment parties were placed in the field to carry out original ground surveys for control of mapping from aerial photographs over widely distributed areas. The field program included the projected helicopter operations in Newfoundland, to complete the topographic mapping of that Province and in northwest Yukon Territory. With the development of technique, instruments and mechanical aids to plotting maps from air photographs, topographical mapping practice has so changed that it is now held to be essential to have photographs of any area to be mapped. These are provided by the Royal Canadian Air Force and by commercial companies.

The Legal Surveys Division makes and records legal surveys of lands belonging to Her Majesty in the right of Canada or of which the Government of Canada has power to dispose, that are situated in the Yukon and Northwest Territories and the National Parks, and that are Indian lands or reserves; prepares and maintains aeronautical charts and flight manuals; prepares electoral maps; plots planimetric base maps from tri-camera aerial photographs; records and indexes survey returns and plans; and distributes plans, maps and aeronautical charts.

The Canadian Hydrographic Service is primarily responsible for the charting of the coastal and inland navigable waters of Canada, the analyses of tides and tidal current phenomena, and the investigation of water-surface elevations of the St. Lawrence-Great Lakes waterway. The resultant data are published in the form of official navigation charts, volumes of Sailing Directions, Tide Tables, and Water Level Bulletins.

Dominion Observatories.—The two main units of the Dominion Observatories are the Dominion Observatory at Ottawa, Ont., and the Dominion Astrophysical Observatory at Victoria, B.C. Permanent magnetic observatories are maintained at Agincourt, Ont., Meanook, Alta., and at Resolute Bay and Baker Lake, N.W.T. Seismic stations for recording earthquakes are operated at Ottawa and Victoria; at Seven Falls and Shawinigan Falls, Que.; Halifax, N.S.; Saskatoon, Sask.; and at Resolute Bay, N.W.T.

The Dominion Observatory at Ottawa is responsible for the time service of Canada, which involves nightly astronomical observations of accurate star positions and radio-broadcast services for distributing accurate time to all parts of Canada. Other astronomical activities centred at Ottawa include upper atmospheric studies by means of meteor observations, studies of the sun and its effect on earthly conditions, and mathematical studies of the atmospheres of the sun and stars. The geophysical work, also administered from Ottawa, includes the magnetic survey of Canada, with emphasis on aids to air and sea navigation, as well as field and observatory work of interest to the geophysical prospector. The methods of seismology are employed not only to study interesting and economically important aspects of the earth's crust in Canada, but also as part of world-wide investigations of the earth's interior. Gravity observations are carried on throughout Canada with a generally similar purpose, special attention being paid to methods of locating economic minerals.

The Dominion Astrophysical Observatory at Victoria is devoted to fundamental research into the physical characteristics of the sun, stars, planets and the material of interstellar space. The 73-inch reflecting telescope is one of the largest in the world and through its use many important contributions have been made to astronomical knowledge.

The Geographical Branch.—The primary function of the Geographical Branch is to organize and make available all the geographical data on Canada and on foreign countries that might be of use in promoting the economic, commercial and social welfare of Canada. Work undertaken by the Branch is of two kinds—the compilation of geographical material of national significance, and geographical surveys in the field. An important project currently in hand is the compilation of an Atlas of Canada.

The Dominion Coal Board.—The Dominion Coal Board was created in October 1947 (11 Geo. VI, c. 57), the functions and duties of which are clearly defined in the Act. The Board is charged with the responsibility of implementing the recommendations of the Royal Commission on Coal and the Act specifically states that it may undertake researches and investigations with respect to:—

- (1) the systems and methods of mining coal;
- (2) the problems and techniques of marketing and distributing coal;
- (3) the physical and chemical characteristics of coal produced in Canada with a view to developing new uses therefor;
- (4) the position of coal in relation to other forms of fuel or energy available for use in Canada;
- (5) the cost of production and distribution of coal and the accounting methods adopted or used by persons dealing in coal;
- (6) the co-ordination of the activities of Government Departments relating to coal;
- (7) such other matters as the Minister may request or as the Board may deem necessary for carrying out any of the provisions or purposes of this Act.

Transportation assistance to extend the markets for Canadian coal was made available to the amount of \$3,018,189 in the year ended Mar. 31, 1951, and 2,699,615 tons of coal were moved under this subvention during the year. Expenditures under the Coke Bounty Act providing a subsidy on Canadian coal used in the manufacture of coke for metallurgical purposes amounted to \$424,725. The amount of coal bonused was 858,031 tons.

The Board continued its studies on problems relating to coal research and of other organizations engaged in the production and distribution of solid fuels.

Subsection 2.—Provincial Government Aid*

Nova Scotia.—Under the provisions of the Mines Act (14 Geo. VI, S.N.S., c. 3), the Government of Nova Scotia may assist a mining company or operator in the sinking of shafts, slopes, deeps and winzes and the driving of adits, tunnels, crosscuts, raises and levels. This assistance may take the form of work performed under contract, the payment of bills for materials and labour, or the guarantee of bank loans. Any such work must be approved by the Department of Mines. The Government is also authorized to assist the mining industry to procure power on the most economical basis, and may guarantee the Nova Scotia Power Commission against any loss incurred on account of capital investments made for that purpose

* Information supplied by the Departments of Mines or Mines Branches of the various provinces.

or revenue. Mining machinery and equipment that may be used in searching for and testing and mining of minerals is available through the Government. Such equipment is under the direct supervision of the Chief Mining Engineer.

The Government of Nova Scotia is also empowered to make any regulations considered necessary for increasing the output of coal. Such regulations cover the appropriation, on payment, of unworked coal lands, operation of coal mines, loans or guarantees for loans. Close co-operation is maintained with the Federal Government in carrying out federal regulations made to secure increased production and economical distribution of coal from the mines of the Province.

New Brunswick.—The Mines Branch of the New Brunswick Department of Lands and Mines examines mineral and rock specimens for prospectors and makes preliminary examinations of mineral prospects where requested. Four diamond drills, which may be used for mineral exploration work on an "at-cost" basis, are made available by the Government.

Quebec.—The Mining Act (R.S.Q., 1941, c. 196) authorizes the Quebec Department of Mines to build, maintain and improve roads needed for mining development. Such work is done by contract, under the supervision of departmental engineers. The Act gives the Department considerable latitude in this respect. In certain cases, major roads have been built to new mining districts and completely paid for; on the other hand, if a particular property requires a branch road from an established highway, the owner may be required to contribute a portion of the cost. To prevent the development of uncontrolled settlements in the vicinity of operating mines, the Department regulates the use of land and permits the establishment of well-organized communities. The municipal organization of such communities is jointly administered by the Department of Mines and the Department of Municipal Affairs.

The Department maintains well-equipped laboratories for the benefit of prospectors, geologists, engineers and mine operators. The facilities include equipment for mineralogy, petrography, ore-dressing, and analysis by wet or dry assays, spectrography or X-ray. Quantitative and mineralogical determinations are made free, but quantitative analyses are made for a fee according to a tariff schedule. The Mining Act provides coupons to be used by prospectors in paying for such analyses.

At Val d'Or in western Quebec, the Department maintains a sampling and treatment plant where tests may be made on bulk samples and where precious metals may be recovered for prospectors at cost price. The treatment plant, which is fully equipped to carry out a wide variety of pilot-scale ore-dressing tests, is at the disposal of mine owners wishing to establish mill-flow sheets. At Thetford Mines, in the heart of the asbestos district, the Department maintains a laboratory where classification of the asbestos is made according to standard designations or grades. The Province has authorized the establishment of research laboratories to assist mining and metallurgical enterprises in the processes and techniques of extracting, transforming and utilizing ores.

The Department undertakes geological mapping and inspection. The work is divided between two branches, one responsible for reconnaissance aerial mapping, the other doing detailed mapping in mining districts and inspection of individual deposits or properties. Field parties are headed by geologists or mining engineers.

The published reports on these investigations are distributed free upon request. During the field season, about 30 parties are maintained in different sections of the Province.

In mining districts, offices, in charge of resident geologists, are maintained to collect, preserve and compile geological information disclosed by mining explorations. The individual sheets of the compiled geology are made available to the public.

The Department employs inspectors whose duties are almost exclusively concerned with the safety of workmen in operating mines. Two Mobile Mine Rescue Stations are also operated and a mine rescue training program conducted.

In the field of education for prospectors, five-week courses at university level are organized each year at Laval and Montreal Universities. University scholarships are granted each year to deserving undergraduates and post-graduates in mining, geology and metallurgy, thus contributing to the training of qualified engineers for the benefit of the mining industry. Lectures are given to prospectors at different localities throughout the Province.

Ontario.—The Ontario Department of Mines renders a multiplicity of services of direct assistance to the mining industry within the Province as briefly enumerated below.

Mining Lands Branch.—This Branch handles all matters dealing with the recording of mining claims, assessment work, etc., and the final issuance of title to mining lands. As a service to the mining public, individual township maps are prepared and kept up to date showing lands open for staking and recorded and patented claims therein. As new surveys are made or later data becomes available, maps are revised in line with such information. District Mining Recorders maintain offices at strategic locations throughout the Province.

Geological Branch.—A continuing program of geological mapping and investigation is carried out by the geological staff of the Department. Detailed reports and geological maps of the areas studied are made available to the public. In many of the active areas of the Province, resident geologists are engaged to gather and make available to the public, information concerning geological conditions, exploration and development within their respective districts. One geologist specializing in industrial minerals is maintained on the staff to examine deposits of this order, investigate methods of treatment and recovery of such minerals, and to compile data on the uses, specifications and markets for such products. Collection and dissemination of information on ground water resources is also a function of a section of the Geological Branch. During the winter months courses of instruction for prospectors are held in various centres throughout the Province.

Laboratories Branch.—The Provincial Assay Office, located in the East Block of the Parliament Buildings, Toronto, carries out wet analyses and assays of metal and rock constituents on a custom fee basis and also renders the same service free of charge to holders of valid assay coupons issued for the performance of assessment work on mining claims. The Temiskaming Testing Laboratories situated at Cobalt, in addition to performing fire assays and chemical analyses, conducts a bulk sampling plant mainly to assist the producers of the area in the marketing of the cobalt-silver ores. A Cable Testing Laboratory, wherein all hoisting ropes in use at the mines are periodically tested, is operated under the supervision of the Inspection Branch.

Inspection Branch.—The main function of this Branch is the regular examination of all operating mines, quarries, sand and gravel pits and certain metallurgical works with a view to ensuring proper conditions of health and safety to the men employed. District offices to serve the local areas are maintained in the major mining centres of the Province. Mine rescue stations in the principal mining sections are operated under the supervision of the Inspection Branch.

Exhibitions.—The Department each year presents displays pertaining to mining within the Province at such exhibitions as the Central Canada at Ottawa, the Canadian National at Toronto, and the Northern Ontario at Schumacher.

Publications Branch.—All maps and reports of the Department are distributed through the agency of the Publications Branch located at the main office of the Department.

Library.—A mining library for departmental reference only is maintained within the Department. This library is comprised mainly of publications and maps of the Federal and Provincial Governments of Canada as well as numerous periodicals and bulletins from the United States.

Mining Roads.—The most recent service of the Department is the provision of mining roads. In general, two classes of road-building are envisioned under this program. The first class of road contemplated is a mining access road, financed solely by the Department, for the purpose of opening up favourable areas for exploration, whereas the second class of road, undertaken jointly by the Department and local mining operators, is intended to assist in the provision of required service roads to such operators.

Manitoba.—Since the transfer, in 1930, of the natural resources of Manitoba from the Government of Canada to the Province, the Mines Branch of the Manitoba Department of Mines and Natural Resources has offered four main services of assistance to the mining industry: (1) maintenance, by the Mining Recorders' offices at Winnipeg and The Pas, of all records essential to the granting and retention of titles to every mineral location in Manitoba; (2) compilation, by the geological staff of the Branch, of information pertinent to mineral occurrences of interest both in the past and the present and expansion of this information by a continuing program of geological mapping; (3) enforcement of mine safety regulations and, by collaboration with industry, initiation of new practices, such as those concerned with mine ventilation and the training of mine rescue crews, which contribute to the health and welfare of mine workers; and (4) maintenance of a chemical and assay laboratory to assist the prospector and professional man alike in the classification of rocks and minerals and the evaluation of mineral occurrences.

Saskatchewan.—The assistance given to the mining industry by the Saskatchewan Provincial Government consists of the following: (1) the maintenance of a Geological Department under a Chief Geologist; (2) resident geologists stationed in or near the principal mining areas; (3) geological survey parties and reports; (4) prospecting concessions; (5) Prospectors' Assistance Plan; and (6) Native Trainees Plan.

The Chief Geologist and a staff are available at all times to give information or any other possible help to interested parties. The Geological Department has headquarters at Regina, with a branch at Saskatoon where a Petroleum Examination Laboratory is located.

Resident geologists are stationed at Goldfields and Prince Albert for the same purpose as that of the main Geological Department and also to give any assistance they can to prospectors in those areas.

During the summer months geological survey parties study and map attractive areas and prepare reports which are made available to interested persons.

Prospecting concessions are granted to companies and individuals of integrity in areas remote from present mining districts. The purpose of this is to encourage the prospecting of such remote areas. It is to be noted that a concession is for prospecting only and any title to mineral rights is secured by the ordinary method of staking claims.

The Prospectors' Assistance Plan is intended to encourage prospecting, and assists bona fide prospectors by way of equipment, food, transportation and technical advice to prospect favourable areas, geologically speaking.

The Native Trainees Plan has a twofold purpose: (1) to train the Indians in the northern part of the Province to recognize the common minerals so that, as they go about their usual work, they will be aware of anything of value they might observe; (2) to train them to a point where they may be used as prospectors for the exploration companies and, in so doing, extend their means of livelihood beyond that of hunting and trapping.

Alberta.—Alberta Government assistance to the mining industry is diversified in character. The Mines Division of the Department of Mines and Minerals regulates coal mines and quarries and maintains standards of safety by inspection and certification of workers. The Workmen's Compensation Board also maintains safety standards and trains mine-rescue crews. The oil and gas industries are served in a similar way by the Petroleum and Natural Gas Conservation Board. Its regulatory measures, however, are also concerned with the prevention of waste of oil and gas resources and with giving each owner of oil and gas rights the opportunity of obtaining a fair share of production. This Board also compiles periodic reports and annual records which are of invaluable assistance in oil development in Alberta. The mining industry is also served by the Research Council of Alberta which has made geological surveys of most of the Province and has carried forward projects concerned with the uses and development of minerals. The Council has studied the occurrence, uses and analysis of Alberta coals, and of their particular chemical and physical properties, the use of coals in generation of power, the upgrading and cleaning of coal and has studied briquetting, blending, abrasion loss, shatter and crushing strength, asphalt binders and dust-proofing of coal. The Council's work with bituminous sands has helped with the development of the hot-water separation process and the operation of pilot plants. Studies have been made of glass sands, salt, fertilizers, cement manufacture and brick and tile manufacture.

The Province from time to time has had commissions examine various aspects of the mining industry when it was considered that their findings would be of assistance in developing such industries. In a recent move, the Province, together with the Canadian Association of Oil Well Drilling Contractors and the Western Canada Petroleum Association, has maintained a detailed supervisory and safety training program concerned with the drilling of oil and gas wells.

Of assistance also to mining companies and oil companies are the special deductions provided for in the Alberta Corporation Income Tax Act. These follow the parallel provisions in the Federal Income Tax Act.

British Columbia.—The Department of Mines of British Columbia provides the following services: (1) detailed geological mapping as a supplement to the work of the Geological Survey of Canada; (2) free assaying and analytical work for bona fide prospectors registered with the Department; (3) assistance in the field to the prospector by departmental engineers and geologists; (4) grubstakes, limited to \$500, for prospectors; (5) assistance in the construction of mining roads and trails; and (6) inspection of mines to ensure safe operating conditions.

Section 3.—Mining Legislation

Federal Mining Laws and Regulations.*—The Federal Government administers the mineral lands of the Yukon and Northwest Territories as well as those within Indian Reserves and in National Parks.

Mining laws and regulations covering the Yukon and Northwest Territories are administered by the Northern Administration and Lands Branch, Department of Resources and Development. Titles issued for federal lands, the property of the Federal Government, in these regions reserve to the Crown the mines and minerals that may be found on or under such lands, together with the right of operation.

Mining rights on vacant and certain other federal lands may be acquired by lease for a period usually of 21 years, renewable for further periods of like duration, on the terms and conditions specified in the various Acts and regulations relating to federal lands.

The disposal of minerals in Indian Reserves is, with the exception of gold and silver, subject to the consent of the Indians owning the Reserve.

The Acts and regulations governing mining and quarrying on federal lands are summarized in Report No. 828 issued by the Mines Branch, Department of Mines and Technical Surveys, Ottawa, and entitled *Mining Laws of Canada*. This publication also lists all the laws and regulations pertaining to mining on federal lands, and copies of these individual laws and regulations may be obtained by applying to the Northern Administration and Lands Branch, mentioned above. Another publication of interest in connection with mining regulations and available from the same source is entitled *Summary Review of Dominion Tax and Other Legislation Affecting Mining Enterprises in Canada*.

Provincial Mining Laws and Regulations.†—All mineral lands lying within the boundaries of the several provinces (with the exception of those within Indian Reserves and National Parks which are under the jurisdiction of the Federal Government) are administered by the respective provincial governments.

The granting of land in any province, except Ontario, no longer carries with it mining rights upon or under such land. In Ontario, mineral rights are expressly reserved if they are not to be included. Some early grants in British Columbia, Alberta, Saskatchewan, Manitoba, New Brunswick and Quebec also included certain mineral rights. Otherwise, mining rights must be separately obtained by lease or grant from the provincial authority administering the mining laws and regulations. Mining activities may be classified as placer, general minerals (or

* Revised under the direction of Marc Boyer, Deputy Minister, in the Editorial and Information Division, Department of Mines and Technical Surveys, Ottawa.

† Compiled from material supplied by the Provincial Governments.

veined minerals and bedded minerals), fuels (coal, petroleum, gas) and quarrying. Under these divisions of the provincial mining industry, regulations may be summarized as follows:—

Placer.—In those provinces in which placer deposits occur there are regulations defining the size of placer holdings, the terms under which they may be acquired and held, and the royalties to be paid.

General Minerals.—These minerals are sometimes described as quartz, lode, or minerals in place. With the exception of British Columbia, the most elaborate laws and regulations apply in this division. In all provinces, except Alberta, a prospector's or miner's licence, valid for one year, must be obtained to search for mineral deposits, the licence being general in some cases but limited in others. A claim of promising ground of a specified size may then be staked. This claim must be recorded within a time limit, with the payment of recording fees, except in Quebec where no fees are required. Work to a specified value³ per annum must be performed upon the claim for a period of up to ten years. There is no time limit in British Columbia but \$500 assessment work, of which a survey may represent one-fifth, must be performed and recorded before a Crown grant may be obtained. In Quebec work must be performed to a specified number of man-days with no time limit, when a grant or lease of the mining rights may be obtained, subject to agreement to develop as well as the payment of fees or an annual rental. The taxation applied most frequently is a percentage of net profits of producing mines or royalties. In the case of Newfoundland, the provincial mining tax has been modified since Confederation on Mar. 31, 1949, to conform with the provincial obligations under the Federal-Provincial Tax Agreement and no other form of taxation or royalties exists.

Fuels.—In provinces where coal¹ occurs,¹ the size of holdings is laid down together with the conditions of work and rental under which they may be held. In Quebec ordinary mining claims give rights to all mineral substances and to their development, but stakings for combustible natural gas, salt, coal, mineral oil or naphtha, or iron sands may cover 1,280 acres² per claim. In some cases royalties are provided for. Acts or regulations govern methods of production. In the cases of petroleum and natural gas, an exploration permit or reservation is usually required. However, in Alberta no such permit or reservation is necessary and the applicant usually takes out a lease, whether or not any discovery is made, because exploration costs are applicable in part on his first year's rental. In other provinces, except Manitoba, the discovery of oil or gas is usually prerequisite to obtaining a lease or grant of a limited area subject to carrying out drilling obligations and paying a rental, fees or a royalty on production.

Quarrying.—Regulations under this heading define the size of holdings and the terms of lease or grant. On Quebec private lands, the quarry belongs to the owner; on Crown lands, mineral rights belong to the Crown and may be obtained in accordance with the provisions of the law, although the rights to exploit peat or marl must be obtained by special licence. In British Columbia quarry rights are not reserved in Crown grants.

Copies of mining legislation including regulations and other details may be obtained from the provincial authorities.

Section 4.—Statistics of Mineral Production

The importance of mineral production, as compared with other primary industries in Canada, is indicated in Chapter IX, while its part in the foreign trade of Canada is dealt with in Chapter XXI, Part II, Section 4.

Subsection 1.—Value and Volume of Mineral Production

Historical Statistics.—Definite records of the annual value of mineral production go back to 1886 only, although actual production began with the earliest settlements. The figures given in Table 1 are not strictly comparable throughout the whole period, minor changes having been adopted in methods of computing both the metallic content of ores sold and the valuations of the products. Earlier methods resulted in a somewhat higher value than those now in use would have shown. However, the changes do not interfere with the general usefulness of the figures in showing the broad trends in the mineral industry.

1.—Value of Mineral Production, 1886-1951

Year	Total Value	Value per Capita	Year	Total Value	Value per Capita	Year	Total Value	Value per Capita

¹ Beginning with 1931, exchange equalization on gold production is included.

² Includes value of Newfoundland production from 1949.

Current Production.—Canada's mineral production in 1951 reached a record value of \$1,228,000,000. This was 17 p.c. above the total for 1950, twice the value reported for 1947 and four times that for 1935. Higher prices accounted for a large share of this increase in values but the physical quantity of mineral production seems to have been about 11 p.c. greater than in 1950, nearly 45 p.c. greater than in 1947 and about double that of 1935. Most of the gain in physical volume in the post-war years was in non-metallic minerals, including fuels and structural materials. For metal production, the index for 1951 was about 2 p.c. over 1950 but it was 15 p.c. below that for 1941, the year of maximum output.

The value of metals in 1951 was estimated at \$733,000,000, or 18.7 p.c. more than in 1950. Copper was up 2.4 p.c. in quantity and 21 p.c. in value; tonnage of nickel was higher by 11 p.c. and the value advanced 34 p.c.; and zinc rose 6.6 p.c. in quantity and 36 p.c. in value. The tonnage of lead was lower by 8 p.c., but the value was higher by 17 p.c. The tonnage of iron ore was 31 p.c. greater than in 1950.

Gold was again the leading mineral in terms of output value in 1951. The price of gold in Canadian dollars ranged from \$37.50 to \$35.80 per oz t., the nominal average being \$36.82 per oz t. compared with \$38.05 in 1950. The lower price, combined with lower volume, resulted in a drop of nearly \$10,000,000 in the total value of the 1951 output.

The gain of 18 p.c. in the value of mineral fuels to \$238,000,000 was due almost entirely to the tremendous increase in production of crude petroleum in Alberta. The output of crude oil totalled 48,000,000 bbl. compared with 29,000,000 bbl. for 1950, and the value was up 43 p.c. to \$121,000,000. Coal production was slightly lower than in 1950.

Structural materials were in greater demand throughout 1951. Output of cement totalled 16,900,000 bbl. valued at \$40,200,000, a new record in tonnage and value. Lime production was up 16 p.c. in value to \$14,200,000 from 1950; clay products, which include brick, tile, sewer pipe, etc., were valued at \$23,600,000, a gain of 8 p.c. over 1950. Stone for buildings, monuments, railway ballast, etc., was valued at \$24,600,000 in 1951 and sand and gravel, mainly for highway construction, totalled \$43,000,000.

In the non-metallic mineral group in 1951, the output of asbestos, the principal item, was up 10 p.c. in tonnage and 20 p.c. in value to 967,000 tons at \$78,800,000. Production of salt increased 12 p.c. to 962,000 tons, a large part being for use in making chemicals. Sulphur in the form of pyrites and sulphuric acid totalled 368,000 tons, a gain of 22 p.c. over 1950; no elemental sulphur was made in 1951. Fluorspar, mostly from Newfoundland, totalled 87,000 tons, a gain of 35 p.c. Gypsum production was about the same as in 1950.

Capital expenditures in the mining industries increased to \$228,000,000 in 1951 from \$182,000,000 in 1950.

During the past few years, the direction of Canadian exports of the principal base metals has been drastically altered. In 1939 the United States took only 3 p.c. of the aluminum production but took 48 p.c. in 1950; the corresponding rise for copper was from 1 p.c. to 38 p.c., for lead from zero to 91 p.c., and for zinc from 4 p.c. to 74 p.c. In 1951 there was a partial swing back again, but the over-all change is still quite a radical one. The fact appears to be that the United States has become for the first time a substantial importer of these metals to meet a steeply rising consumption as well as for strategic stockpiling.

Analysis of Current Value and Volume.—In order to interpret more clearly and simply the trends in mineral production in Canada over the past ten years, Table 3 gives the percentage of the total value contributed by each principal mineral in each year. Values upon which percentages in this table are based are the annual values of mineral production, expressed in Canadian currency, as shown in Tables 1 and 2.

3.—Percentages of the Total Value Contributed by Principal Minerals, 1941-50

Although the year 1926 was not a normal year in mineral production to the same extent as in some other productive fields, the rapid changes that have resulted from circumstances arising since then can be seen more clearly by using 1926 as a base year. Table 4 shows the indexes of volume of mineral production by principal minerals, for the years 1941-50.

Subsection 2.—Provincial Distribution of Mineral Production

Since 1907, Ontario has been the principal mineral-producing province of Canada. In 1942 that Province accounted for 46 p.c. of Canada's total, but its share declined steadily to 36 p.c. in 1951. Alberta's share of the total showed the greatest increase in the ten-year period, rising from 8 p.c. to 14 p.c., and accounted for by the tremendous increase in the crude petroleum output of that Province. The proportion contributed by Quebec increased in the same period from 18 p.c. to 20 p.c. British Columbia, Saskatchewan and Manitoba remained about the same with 14 p.c., 4 p.c., and 2 p.c., respectively, while Nova Scotia decreased from 6 p.c. to 5 p.c. Newfoundland produced 4 p.c. of the total mineral production of Canada in 1951. As compared with 1950, gains in value were registered for all provinces except Nova Scotia, New Brunswick and Manitoba.

5.—Mineral Production, by Provinces, 1942-51

NOTE.—Figures for the years 1899-1910, inclusive, will be found at p. 345 of the 1933 Year Book; for 1911-28 at p. 323 of the 1939 edition; and for 1929-41 at p. 323 of the 1946 edition.

Subsection 3.—Production of Metallic Minerals

The metals of chief importance in Canada are copper, gold, iron, lead, nickel, those of the platinum group, silver and zinc. These metals are dealt with individually in the following paragraphs. In addition, there are a number of metals produced in minor quantities, principally as by-products in the treatment of metalliferous ores (*see* Tables 2 and 6).

Copper.—Copper production increased about 2.4 p.c. in 1951 to 270,500 tons. This was the largest tonnage reported in the post-war period but it was less than the amount recovered in each of the years from 1938 to 1944, inclusive, and was about 16 p.c. below the record of 321,700 tons in 1941.

According to the preliminary figures, the output in Ontario, which usually accounts for about one-half of the total, was approximately 10 p.c. greater in 1951 than in 1950. In British Columbia and in the Manitoba-Saskatchewan producing area there were small advances over the previous year but in Quebec there was a decline of about 4 p.c. and in Newfoundland a decrease of more than 14 p.c.

About 48 p.c. of Canada's copper comes from the nickel-copper mines in the Sudbury district of Ontario. Converter copper is produced and further treated at Copper Cliff, and nickel-copper matte produced at Falconbridge is exported to Norway for refining. Mines in northern Quebec account for 26 p.c. of Canada's copper production. These ores are treated at Noranda to produce copper anodes which are shipped to Montreal, Que., for refining. Ores from the Flin Flon-Sheritt Gordon area in northern Manitoba, and extending over the border into Saskatchewan, are also treated at Noranda and the blister copper recovered is shipped to Montreal for refining. Mines in this area account for 17 p.c. of production. British Columbia mines account annually for about 8 p.c. of Canada's copper, and concentrates produced in this area are exported to the United States for treatment. Concentrates from Newfoundland, that amount to about 1 p.c. of the total, are exported to Belgium and to the United States.

Output of refined copper was slightly greater in 1951 than in 1950, amounting to 246,000 tons. A larger percentage was channelled into Canadian industry, the amount being 134,000 tons or 54 p.c. of production compared with 107,000 tons or 45 p.c. of the total in 1950. Exports dropped off accordingly to 102,000 tons from 134,000 tons. About 51 p.c. of the 1951 exports went to the United Kingdom compared with 48 p.c. in the previous year while only 28 p.c. went to the United States as against 38 p.c. in 1950. About 37,000 tons of copper were exported in the form of ores and concentrates or in nickel-copper matte.

7.—Copper Production, by Provinces, with Total Values, 1942-51

NOTE.—Figures for the years 1866-1910, inclusive, will be found at p. 272 of the 1916-17 Year Book; for the years 1911-28 at p. 335 of the 1939 edition; and for 1929-41 at p. 331 of the 1946 edition.

(QUANTITY AND VALUE OF LEADING METALLICS)

PRODUCTION ———

VALUE - - - - -

Gold.—The gradual increase in gold production in recent years in the face of rising costs was reversed in 1951 when there was a decline of about 2.5 p.c. to 4,329,000 oz t. Had it not been for the prolonged strike at the Hollinger mine, there probably would have been little difference in the figures for 1950 and 1951. The present rate of production is greater than at any other time except the five-year period from 1938 to 1942, inclusive. The record output was in 1941 at 5,345,000 oz t.

The cancellation in September 1950 of the officially controlled rates of foreign exchange and the subsequent rise of the Canadian dollar in terms of the United States dollar brought about a decline in the average price of gold to \$36.82 per oz t. in 1951, in terms of Canadian currency, from \$38.05 in 1950. On the other hand, the decision of the Government early in October 1951 to permit sales of industrial gold in the premium market, while not of much advantage in 1951, should be of considerable benefit in the future particularly to the mines receiving little help from the Emergency Gold Mining Assistance Act.

Ontario's mines accounted for over 56 p.c. of the 1951 output and Quebec's mines for nearly 25 p.c. Only the Northwest Territories and Saskatchewan showed higher figures than in 1950 but declines in other provinces were not great.

Gold still leads all other mine products in annual value of production and the gold-mining industry holds first place in Canada's mineral economy. With regard to employment, it is nearly the same as coal mining and considerably ahead of other mining industries. It spends about \$40,000,000 annually on mine and mill supplies, electricity and fuels.

8.—Quantities and Values of Gold Produced, by Provinces, 1942-51

NOTE.—Values are calculated at world prices in Canadian funds. Figures for the years 1862-1910, inclusive, will be found at pp. 268-270 of the 1916-17 Year Book; for the years 1911-28 at pp. 336-37 of the 1939 edition; and for 1929-41 at p. 332 of the 1946 edition.

Iron Ore.—Production of iron ore in 1951 at 4,700,000 tons was the largest on record being about 31 p.c. over the 1950 figure. This tonnage is also close to the country's present requirements but the premium quality ores from northern Ontario are in demand by the steel makers in the United States, so that there is an exchange of more than 3,000,000 tons annually.

Developments now under way in the iron-ore industry give promise of greatly increased production within the next few years. The Wabana mine in Newfoundland is being completely mechanized and output will be stepped up next year; the Helen mine in the Michipicoten district in northern Ontario has changed over to underground operations; and Steep Rock in northwestern Ontario is proceeding steadily with its expansion program. Near Marmora, in southeastern Ontario, the Bethlehem

Steel Corporation has outlined a large body of magnetite ore and is now preparing to bring the property into production. In Quebec-Labrador, the 360-mile railway from Seven Islands on the St. Lawrence River is being speeded up, additional reserves of ores have been established and initial shipments are expected in 1954.

9.—Iron-Ore Shipments and Production of Pig-Iron, Ferro-Alloys and Steel Ingots and Castings, 1942-51

NOTE.—Figures for the years 1886-1910, inclusive, will be found at p. 373 of the 1936 Year Book; for the years 1911-28 at p. 340 of the 1939 edition; and for 1929-41 at p. 333 of the 1946 edition.

¹ Includes production of 1,272 tons in British Columbia.

Lead.—Output of lead at 152,500 tons in 1951, was the smallest recorded since 1944 and it was 8 p.c. below 1950 and 40 p.c. under the record production of 256,071 tons in 1942. In British Columbia, which is the principal producing area, output decreased by 11,000 tons or 8 p.c. from the 1950 figure and in Newfoundland it declined nearly 2,000 tons or 10 p.c. In Yukon Territory and in Quebec recoveries were maintained at about the same level as for 1950.

Production of refined lead, including some made at the Trail smelter from imported ores, totalled 163,000 tons of which about 60,000 tons or 37 p.c. were retained for home consumption. Here again there was a marked shift in the direction of exports with 33 p.c. going to the United Kingdom compared with only 7 p.c. in 1950, and 57 p.c. to the United States as against 91 p.c. in the previous year.

10.—Quantities and Values of Lead Produced from Canadian Ores, 1942-51

NOTE.—Figures for the years 1887-1910, inclusive, will be found at p. 367 of the 1929 Year Book; for 1911-28 at p. 341 of the 1939 edition; and for 1929-41 at p. 333 of the 1946 edition.

Nickel.—About 90 p.c. of the world's nickel comes from the Sudbury area in northern Ontario. There are two large operators in this district, the International Nickel Company of Canada Limited which has a smelter at Copper Cliff and a nickel refinery at Port Colborne, Ont., and the Falconbridge Nickel Mines Limited which operates a smelter at the mine site but exports the matte to Norway for refining. Some nickel was recovered in the form of oxides and salts from cobalt ores treated at the Deloro smelter of the Deloro Smelting and Refining company.

A gain of 11 p.c. in 1951 brought the output of nickel to 137,000 tons, almost 5 p.c. below the record of 144,000 tons attained in 1943. Expansion programs are under way by both major producers in the Sudbury area. Sherritt-Gordon Mines Limited is constructing a refinery, to process Lynn Lake concentrates, at Edmonton which should be ready for operation in 1954.

Consumption of refined nickel by Canadian users was only about 2,000 tons in 1951, while exports totalled 72,357 tons. Exports of nickel in matte and oxide aggregated 58,826 tons.

11.—Quantities and Values of Nickel Produced, 1942-51

NOTE.—Figures for the years 1889-1910, inclusive, will be found at p. 368 of the 1929 Year Book; for 1911-28 at p. 342 of the 1939 edition; and for 1929-41 at p. 333 of the 1946 edition.

Metals of the Platinum Group.—This group of metals includes palladium, rhodium, ruthenium, osmium and iridium, with platinum and iridium as the most important. These metals occur in the nickel-copper ore of the Sudbury district and are recovered in the tank residues from the nickel refinery at Port Colborne, Ont. The crude residues are sent to the refinery at Acton, England, for refining. The large increase in the output of nickel-copper ores has made Canada the leading producer of platinum since 1934, when it displaced the U.S.S.R. The industrial uses of the platinum metals have expanded considerably in recent years, particularly in electrical and chemical equipment, jewellery and in medical and dental appliances. Canada produced 317,000 oz. t. of platinum metals with a total value of \$22,536,000, in 1951.

12.—Quantities and Values of Platinum and Iridium¹ Produced, 1942-51

NOTE.—Records of the platinum production in Canada go back to 1887 but, prior to 1921, the amounts were comparatively small and the basis of calculation was not comparable with that now used. Figures for the years 1921-39 will be found at p. 340 of the 1940 Year Book and for 1940-41 at p. 513 of the 1951 edition.

¹ Includes also palladium, rhodium, ruthenium and osmium.

² The 1945 figures include an accumulated revision for previous years.

Silver.—Silver production in 1951 at 24,245,000 oz t. was the greatest since 1930 and except for that one year it was better than at any time since the period from 1909 to 1916, when operations in the Cobalt district were at their height. The renewed activity in this area brought about a further increase of 21 p.c. in Ontario's output which totalled 5,357,000 oz t. in 1951. Saskatchewan's output increased by 24 p.c. over that of 1950 and in Yukon Territory there was an advance in production of nearly 13 p.c.; in other areas the recoveries were slightly less than in 1950.

Silver mining is not a distinct industry in Canada as the silver-bearing minerals occur in association with other metals of economic value. Most of the metal is obtained from the treatment of base-metal ores although substantial amounts are recovered from gold-quartz ores and from alluvial gold deposits. In 1951, approximately 35 p.c. of Canada's silver came from British Columbia, 22 p.c. from Ontario, 17 p.c. from Quebec, nearly 15 p.c. from the Yukon and Northwest Territories, and about 6 p.c. from Saskatchewan.

The average price of silver at 94.6 cents per oz t. in Canadian funds in 1951 was the highest since 1920.

¹ Includes relatively small quantities produced in Alberta.

Zinc.—In contrast to copper, lead and nickel, the 1951 output of zinc was higher than in the peak war years and exceeded the former record year 1950 by about 6.6 p.c. or 334,000 tons. In British Columbia and in the Manitoba-Saskatchewan area there were production gains of about 10 p.c., and there was also a

substantial increase in Newfoundland. Quebec, which is second among the provinces in zinc production, accounted for about 26 p.c. of the Canada total, the output being practically the same as in 1950.

About 65 p.c. of the total zinc is refined in Canada and a considerable tonnage of zinc is recovered at Trail, B.C., from the treatment of imported ores. Output totalled 219,000 tons in 1951 of which about 61,000 tons were shipped to Canada users. Exports of refined zinc totalled 146,000 tons, including 84,000 tons to the United States and 55,000 tons to the United Kingdom. The percentage shipped to the United Kingdom rose to 38 p.c. from 24 p.c. in 1950 while that for the United States dropped to 58 p.c. from 74 p.c.

14.—Quantities and Values of Zinc Produced, 1942-51

NOTE.—Figures for the years 1911-28 are given at p. 347 of the 1939 Year Book; for 1929-41 at p. 335 of the 1946 edition.

Subsection 4.—Production of Non-Metallic Minerals (Excluding Fuels)

The most important minerals in this group are asbestos, salt, gypsum and sulphur, but it also includes numerous other items such as feldspar, graphite, iron oxide, magnesitic dolomite, mica, nepheline syenite, peat moss, silica brick, sodium sulphate, soapstone and talc (*see* Tables 2 and 6).

Asbestos.—The 1951 figures indicate a gain of almost 11 p.c. over 1950 in output of asbestos to 967,000 tons, including 941,000 tons from Quebec and 26,000 tons from Ontario. Except for 1949, when a labour dispute kept the mines idle for an extended period, there has been a remarkable growth in this industry in recent years and further expansion is under way involving expenditures of about \$35,000,000, mostly in Quebec. The Munro mine near Matheson, Ont., has worked at capacity since it started in 1950. At present the Cassian property in British Columbia is being made ready for production.

15.—Quantities and Values of Asbestos Produced, 1942-51

NOTE.—Figures for the years 1896-1910, inclusive, will be found at p. 424 of the 1911 Year Book; for the years 1911-28 at p. 354 of the 1939 edition; and for 1929-41 at p. 353 of the 1946 edition.

Salt.—Salt is obtained from brine wells in the Provinces of Ontario, Manitoba and Alberta, but in Nova Scotia it is recovered by mining rock-salt and by evaporation from brine. Domestic production is sold principally to the dairy, meat-curing and canning industries, to fisheries, to highways and transport departments, to agriculturists for use as a soil sweetener, to chemical industries, and as table salt. About 50 p.c. of the salt production is used in making caustic soda, soda ash and related chemicals. In 1951, Ontario produced about 80 p.c. of the Canada total.

Gypsum.—The use of gypsum in the building trades has increased rapidly and Canada has extensive deposits of gypsum favourably situated for commercial developments. A production peak was reached in 1950 at 3,666,336 tons, the 1951 output being slightly lower. About 85 p.c. of the output is exported each year, mainly in crude form to the United States.

17.—Quantities and Values of Gypsum Produced, by Provinces, 1942-51

Sulphur.—Sulphur production statistics given in Table 18 represent the quantity and value of sulphur contained in iron pyrites shipped, plus the quantity and value of sulphur reclaimed for acid manufacture, etc., from smelter fumes. The Shell Oil Company and the Royalite Oil Company have recently completed plants in Alberta to recover elemental sulphur from natural gas. These units have a capacity of nearly 20,000 tons annually. Canadian Industries Limited has a plant under construction at Copper Cliff, Ont., to make liquid sulphur dioxide, utilizing the smelter gases from International Nickel's smelter at that point.

18.—Quantities and Values of Sulphur Produced, 1942-51

Subsection 5.—Production of Fuels

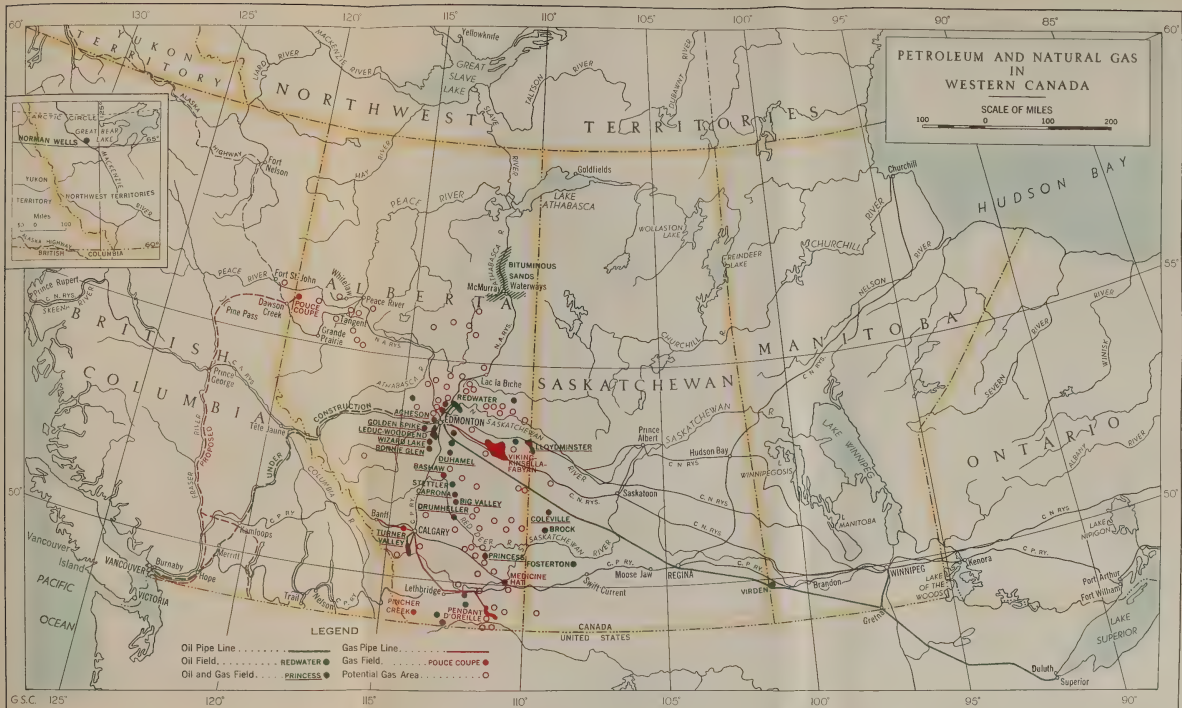

Information on the coal reserves of Canada is given in the Year Book 1950, pp. 516-518.

CANADIAN CRUDE PETROLEUM SITUATION*

The mineral industry in Canada has shown a rapid and very substantial expansion during the past few years but no part of it has quite equalled the spectacular developments that have resulted from the major discoveries of petroleum and natural gas in Western Canada. During World War II the tempo of exploration was speeded up by the need for oil products and by the encouragement given to the search for new supplies through tax concessions granted by the Federal Government. At that time Turner Valley in the foothills of the Rockies, 35 miles southwest of Calgary, was the main producing field, a peak production of about 29,000 bbl. a day having been reached in 1942. This was not sufficient to supply the military and restricted civilian requirements of the Prairie Provinces, where light oil was needed particularly for refining into products required by the Commonwealth air-training project. However, some small fields were found and, in the light of present events, two occurrences were of major significance although not recognized as such at the time. The first of these was the discovery in 1944 of light crude oil in the Devonian limestones at Princess, on the plains, 100 miles east of Calgary. This was the first discovery of Devonian oil in Alberta. The second was the development, through the Canol project, of the Norman Wells field in the Mackenzie River Valley, 50 miles south of the Arctic circle. This field was found in 1920 also in Devonian rocks but, owing to lack of markets for the oil, there had been no significant development. Under the Canol project many wells were drilled and it was recognized that the productive horizon was a coral reef. The Princess field is 1,150 miles distant from Norman Wells and although both were yielding oil from the Devonian, no special significance was attached to this fact at that time.

The discovery of the Leduc field southwest of Edmonton in 1947 completely changed the whole oil aspect in Western Canada. The oil at Leduc, like that at Norman Wells, was found in a Devonian coral reef. United States oil companies in particular were very familiar with coral-reef production in the Permian basin of West Texas and New Mexico and quickly recognized the significance of the new Leduc discovery. Consequently, the Leduc discovery, both from its character and the size of the possible productive area, attracted more than usual attention

* Prepared by Dr. G. S. Hume, Director-General of Scientific Services, Department of Mines and Technical Surveys.

and a number of companies began to study the situation with respect to the acquisition of lands and the right to explore for oil. The discovery of the Redwater field in 1948 followed by the discovery of the Woodbend extension of the Leduc field, by Imperial Oil Limited, led to increased exploration activity by many companies, which, as new finds have been made, has been quickly expanded to cover not only the desirable prospective oil lands in Alberta, Saskatchewan and Manitoba but has been extended northwestward involving much of the northeastern corner of British Columbia east of the mountains and embracing large areas within the Northwest Territories south and west of Great Slave Lake.

In Alberta there have been numerous oil fields discovered in a tract of land extending from Edmonton to Drumheller. Development began with the discovery of the Stettler field in 1949, followed by such finds as Duhamel, Big Valley, Caprona, New Norway, Bashaw and Drumheller. To the west of Edmonton there is the Acheson-Stony Plain field and west of Leduc the Golden Spike field. To the south of Leduc there are a number of small oil fields—Wizard Lake found in 1951 and Bonnie Glen found early in 1952 are major discoveries in this area. Golden Spike, Wizard Lake and Bonnie Glen are of particular importance in that, although their real extent may not be large in comparison with some of the other fields, the thickness of oil-saturated coral formation is exceptional, in all three exceeding 100 ft., and in Bonnie Glen reaching the phenomenal thickness of 688 ft. This means that production per acre will be very large in comparison with some of the other fields where, as for example at Leduc, there are two oil zones in the Devonian each with a thickness of approximately 35 ft. The search for these pools of small surface extent, therefore, must be very intense, with no small area neglected in the promising oil territory.

In addition to the discoveries in the area of Edmonton and the southern part of Alberta, there have been two recent discoveries of oil in Saskatchewan of a quality considerably lighter than the oil being produced from the Lloydminster and Coleville fields. Southern Saskatchewan and southwestern Manitoba are occupied by the northward part of the Williston basin of North Dakota. In the Williston basin in United States there have recently been two very important oil discoveries, so that the finding of oil in Saskatchewan and small but significant discoveries in southwestern Manitoba have had a very stimulating effect in encouraging development in this part of Western Canada. To the northwest of Edmonton in the Peace River area of Alberta, there have been two oil discoveries and a number of very significant gas discoveries. In the St. John area of British Columbia there has also been a light oil discovery, which, although not large, is very important as indicative of excellent oil prospects, while recent gas discoveries give promise of large production.

Some indication of the amount of exploration being done in Western Canada in the search for oil and gas can be obtained from the drilling record. In 1951, 1,371 wells were completed in the four western provinces. The main part of this development was in Alberta where 1,228 completed wells accounted for more than 500,000 ft. of drilling in each of the last seven months of the year. These wells consisted of 757 oil wells, of which 35 were new discoveries and the remainder were development wells in oil fields, and 166 gas wells, of which 63 were new discoveries and 355 dry holes. Recoverable reserves of petroleum in Alberta are now estimated at about 1,500,000,000 bbl. In Saskatchewan, 112 wells were completed consisting of 53 oil wells, of which 2 were new discoveries, and 6 gas wells, of

which 3 were new discoveries and the remainder dry holes. Manitoba produced its first oil from the southwestern part of the Province where two oil discoveries were made out of 16 wells drilled, of which all but 5 were dry holes. British Columbia also had its first crude oil discovery and, of 15 wells completed, one is an oil well, 3 are gas wells and 11 failed to find commercial production of either oil or gas.

Production of petroleum in Western Canada is now largely governed by the outlets and, at present, potential capacity exceeds actual output by a considerable amount. In 1951, production in Alberta showed a phenomenal increase of 68 p.c. over 1950 and amounted to 46,403,000 bbl. This was largely due to the opening up of Ontario markets through the building of the 1,126-mile interprovincial pipe line from Edmonton to Superior, Wis., U.S.A., at the head of the Great Lakes. At the end of 1951, Alberta had a total of 2,747 wells producing or capable of producing oil compared with 1,988 at the end of 1950 and 1,220 at the end of 1949. Peak production was reached during the week of Aug. 20, 1951, when the daily average was 189,423 bbl. Output during the winter months, however, is much lower and dropped to approximately 82,000 bbl. a day during the week ended Dec. 31, 1951. Potential production, however, is said to be around 200,000 bbl. a day and, owing to an expected increase, plans are now under way to build a pipe line from Edmonton to Vancouver via Yellowhead Pass, Kamloops, Merritt, Hope and Chilliwack to Burnaby. Initially this pipe line will supply only the needs of the Canadian west coast market and thus is designed for about 75,000 bbl. a day. By increasing the number of pumping stations, however, the pipe line will be capable of transporting 200,000 bbl. a day and it is hoped that part of the market in the Pacific northwest area of United States may be opened to this outlet. In addition to this western outlet, which will not be completed until 1953, the interprovincial pipe line outlet to Superior is being increased by looping the line around the high-pressure parts of the first line. Additional storage is also being built at Superior, Wis., and two new tankers, each with a capacity of 115,000 bbl., will be put into service on the Great Lakes during the 1952 shipping season. In conjunction with this the Imperial Oil refinery at Sarnia is being increased to a capacity of 71,000 bbl. a day and Canadian oil companies have built a new 20,000-bbl.-a-day refinery at nearby Froomfield. Imperial Oil Limited also has under construction a products line from Sarnia to Toronto via London and Hamilton, Ont.

The discoveries of oil in Western Canada have been accompanied by greatly increased gas supplies and the problem of the export of gas is now before the Alberta Government. The availability of large amounts of natural gas as well as gaseous products from additional refineries has led to a great development of petro-chemical industries in Alberta, principally in the Edmonton area. There are, however, large shut-in gas supplies and these have been increased enormously during the past few years.

The greatly accelerated pace of activity in exploration during 1951, when \$200,000,000 was spent, and the announcement by various oil companies of even greater expenditures in 1952 indicate continued rapid growth of the petroleum and natural gas industries in Western Canada. It is hoped, even though Western Canada's oil cannot reach the markets in the far parts of Eastern Canada on account of transportation difficulties, that production will soon reach the point of self-sufficiency on balance where exports are equal to imports. Prairie self-sufficiency was reached in 1950 and, with the building of the trans-mountain pipe line, Western Canada may be wholly supplied by 1953 by Canadian oil although,

to do this, refining capacity on the west coast must be sufficient in amount and properly adapted to meet the market demands. It is not unlikely that Ontario will continue to receive increasingly large amounts of crude oil from Western Canada. However, the interrupted shipping season on the Great Lakes during the winter season is a great handicap to easy transportation and, for this reason, it is not at present clear how large a part of the Ontario or Quebec markets can be supplied from Western Canada, particularly as about one-third of the refining capacity of Canada is now centred in the Montreal area which is supplied by pipe line from Portland, Maine, with oil largely from Venezuela. But even though Western Canada's oil may be at some disadvantage in reference to easy markets of large size, there can be no doubt that, as a result of developments now under way, Canada will continue to enjoy the benefits that come with large new oil and gas discoveries.

Coal Production.—More coal was produced by Canadian mines in 1950 than in any other year, the total of 19,139,112 tons being slightly above the 1949 production. In 1951, increases were reported for New Brunswick, Saskatchewan and British Columbia, but output elsewhere decreased considerably; total production was lower in Nova Scotia, Alberta and Yukon Territory as compared with 1950.

19.—Coal Production, by Provinces, 1942-51

NOTE.—Figures for the years 1874-1910, inclusive, will be found at p. 419 of the 1911 Year Book; for the years 1911-28 at p. 348 of the 1939 edition; and for 1929-41 at p. 347 of the 1946 edition.

Coal Consumption.—The sources of coal consumed in Canada in the years 1942-51 are shown in Table 22 and detailed figures of coal made available for consumption in 1951 are given in Table 23; the difference between the totals of the two tables in the same year is accounted for by the fact that coal received may be held in bond at Canadian ports and not cleared for consumption until required, while coal received in previous years may be taken out of bond (cleared for consumption) in a later year. Normally, the coal made available for consumption is greater than the apparent domestic consumption, since coal is landed at Canadian ports and re-exported or ex-warehoused for ships' stores without being taken out of bond but, while remaining in bond at the port, it is available for domestic consumption if required.

20.—Imports¹ of Anthracite, Bituminous and Lignite Coal, 1942-51

NOTE.—Anthracite dust is included under anthracite coal. Figures for the years 1868-1910, inclusive, will be found at p. 420 of the 1911 Year Book; for the years 1911-28 at p. 349 of the 1939 edition; and for 1929-41 at p. 348 of the 1946 edition.

¹ Includes Manitoba production of 12,000 bbl. valued at \$30,000.

Natural Gas Production.—Alberta accounts for about 87 p.c. of Canada's production of natural gas. It is estimated that the total output for all provinces was almost 74,000,000,000 cu. ft. in 1951, of which 64,000,000,000 cu. ft. was from Alberta's wells. Ontario's production amounted to almost 9,000,000,000 cu. ft. in 1951. (See also pp. 480-481.)

25.—Quantities and Values of Natural Gas Produced, by Provinces, 1942-51

NOTE.—For the years 1892-1919, see the Annual Report, *Mineral Production of Canada, 1928*, p. 188; for the years 1920-28 see p. 347 of the 1940 Year Book; and for 1929-41, p. 350 of the 1946 edition.

¹ Includes small amounts produced in Saskatchewan and the Northwest Territories.

Subsection 6.—Production of Structural Materials

Production of structural materials is dependent upon the activity of the construction industry; output in 1951 reached a record value of \$145,496,000. This group includes clay and clay products (brick, drain tile, sewer pipe, etc.), cement, lime, sand, gravel and stone.

26.—Values of Structural Materials Produced, by Provinces, 1942-51

NOTE.—Figures for the years 1926-41 are given at p. 355 of the 1946 Year Book.

¹ Includes value of cement containers.

Clay Products.—The sales value of clay products in 1951 was the highest recorded, increasing over 1950 values in all provinces except Manitoba, Saskatchewan and Alberta. Common clays, suitable for the production of building bricks and tile are found in all the provinces; production is greatest in Ontario and Quebec. Stoneware clays are largely produced from the Eastend and Willows areas in Saskatchewan and shipped to Medicine Hat, Alta., where, utilizing the cheap gas fuel, they are manufactured into stoneware, sewer-pipe, pottery, tableware, etc. Stoneware clay also occurs in Nova Scotia some of which is used for pottery though it

has not been developed extensively for ceramic use. Two large plants and a few small plants manufacture fireclay refractories from domestic clay in British Columbia, Saskatchewan and Nova Scotia. Deposits of high-grade, plastic, white burning clays occur in northern Ontario and clay deposits yielding a high-grade of china clay have been found along the Fraser River in British Columbia but these have not been used on a commercial scale. Ball clays of high bond strength occur in the White Mud beds of southern Saskatchewan but have not been developed to any extent.

27.—Values (Total Sales) of Clay Products Produced, by Provinces, 1942-51

NOTE.—Figures for the years 1926-41 are given at p. 356 of the 1946 Year Book.

Cement.—The production of cement has increased greatly since the end of World War II. The largest production is in Quebec and Ontario although there are active plants in Manitoba, Alberta and British Columbia. The imports of cement have also been relatively high during the same period. New plants are under construction at Havelock, N.B., and at Humbermouth, Nfld., which will increase the country's capacity by about 1,500,000 bbl. per year.

28.—Quantities and Values of Production (Sales), Imports and Exports and Apparent Consumption of Portland Cement, 1942-51

NOTE.—Figures for the years 1910-28 are given at p. 356 of the 1939 Year Book; and for 1929-41 at p. 356 of the 1946 edition.

¹ 'Production' as used here means quantity and value of sales.

² The barrel of cement equals 350 lb.

Sand, Gravel and Stone.—Deposits of sand and gravel are numerous throughout Eastern Canada, with the exception of Prince Edward Island where gravels are scarce. The local needs for these materials are usually supplied from the nearest deposits as their cost to the consumer is governed largely by the length of the haul. This accounts for the large number of small pits and the small number of large plants. Every province, except New Brunswick and Prince Edward Island, produces natural bonded sand but some grades particularly suitable for certain industries demand a much higher price than ordinary sand. Quebec and Ontario contributed 76 p.c. of the total quantity of sand and gravel in 1951. The greater part of the output is used in road improvement, concrete works and railway ballast, and most of the commercial plants are equipped for producing crushed gravel, a product that can compete with crushed stone.

The stone industry has two main divisions, stone quarrying and the stone-products industry. The granite, limestone, marble, sandstone and slate quarries of Canada yield high-grade structural and decorative materials and also supply requirements for chemical and other allied industries. The gross value of stone of all varieties produced in Canada in 1950 totalled \$25,895,357 as compared with \$20,528,073 in 1949.

Section 5.—Industrial Statistics of the Mineral Industries

The scope of the annual statistics on mineral production published by the Dominion Bureau of Statistics includes a general review of the principal mineral industries, such as the copper-gold, silver-lead-zinc, and nickel-copper industries, as well as a section on metallurgical works. Additional data published at irregular intervals include such features as capital employed, numbers of employees, wages and salaries paid and net value of sales.

The figures for 'net value of shipments' of industries given in Tables 30 and 31 are, in each case, the settlements received for shipments by producers and the additional values obtained when the smelting of ores is completed in Canada, less the cost of materials, fuel, etc. The totals indicate more nearly the actual returns to the different industries than do the values for the minerals in Table 2 of this Chapter where, in the case of copper, lead, zinc and silver, the values are computed by applying the average prices for the year in the principal metal markets to the total production from mines and smelters with no reduction for fuel, electricity and other supplies consumed in the production process. Some imported ores and concentrates are treated in Canadian non-ferrous smelting and refining works, especially in the production of aluminum, where imported ore only is used, and of cobalt which comes mainly from African ores. The net sales of these plants include, therefore, the net value of the metals recovered from these imported ores and, to this extent, the net sales shown in Tables 30 and 31 include products of other than Canadian origin.

NOTE.—The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.

Section 1.—Water-Power Resources and Their Development*

Canada, a land of many lakes and rivers, has been abundantly endowed by nature with great water-power resources which are well distributed across the country. In most sections, adequate precipitation and favourable topography result in numerous rivers on which falls and rapids frequently occur and offer excellent opportunities for the development of hydraulic power; with the exception of the prairies of the middle west, water-power resources of importance are found in virtually every part of the country. In British Columbia, where precipitation is high, the rivers flowing down the Pacific slope of the Rocky Mountains offer many fine power sites. Alberta, although a prairie province, also has mountain streams from the Rockies as well as great reserves of undeveloped power on its large northern rivers. The great Canadian Shield of Precambrian rock, which forms an arc around Hudson Bay, covers a portion of the Northwest Territories and northern Saskatchewan as well as a large part of Manitoba, Ontario, Quebec and Labrador; it is a rough, forest-covered, well-watered area characterized by innumerable lakes and by rivers with many falls and rapids. The potential power of the Great Lakes-St. Lawrence River System forms part of the great resources of Ontario and Quebec upon which their status as the principal manufacturing provinces of Canada is dependent and which compensates in large degree for the lack of indigenous coal. In New Brunswick, Nova Scotia and on the Island of Newfoundland, the precipitation is moderately heavy and the rivers, while not large, afford numerous possibilities for power developments of moderate size. In Labrador, the potential resources of the Hamilton River are outstanding.

An accurate comparison of Canada's water-power resources and their development with those of other countries† is not possible owing to incomplete world statistics and differing bases of tabulation. However, from available figures as of the end of 1950, it appears that Canada ranks second among the countries of the

* Revised under the direction of Major-General H. A. Young, Deputy Minister, Department of Resources and Development, by Norman Marr, Chief, Water Resources Division.

† More detailed information on the water-power resources of other countries is given in the Year Book 1951, pp. 531-533.

world in total installed capacity, being exceeded only by the United States; in installation per thousand population, Canada is exceeded only by Norway. Canada is in approximately sixth place in potential power resources but those resources are, on the whole, more readily available to prospective markets than is the case in other countries that outrank Canada, an exception being the United States. In particular might be mentioned the enormous potential resources of the great river systems of Africa and Asia.

Subsection 1.—Available and Developed Water Powers in Canada

Table 1 gives a summary of the water-power resources of Canada and their development as at Dec. 31, 1951.

1.—Available and Developed Water Power, by Provinces, as at Dec. 31, 1951

Province or Territory	Available 24-Hour Power at 80 p.c. Efficiency		Turbine Installation
	At Ordinary Minimum Flow	At Ordinary Six-Months Flow	
	h.p.	h.p.	h.p.
Newfoundland.....	1,135,000	2,585,000	279,160
Prince Edward Island.....	500	3,000	2,299

Saskatchewan.....	550,000	1,120,000	111,835
Alberta.....	508,000	1,258,000	207,825
British Columbia.....	7,023,000	10,998,000	1,358,808
Yukon and Northwest Territories.....	382,500	814,000	28,450
Canada.....	29,385,500	50,310,000	13,342,504

The figures given in the first and second columns of the above table represent 24-hour power and are based upon rapids, falls and power sites of which the actual drop, or the head of possible concentration, has been measured or at least carefully estimated. Under a 1951 revision following a review of stream-flow records, the estimates of potential power, particularly in the Province of Quebec, were appreciably increased, principally as a result of the use of higher run-off factors in computing or estimating available flows. The increase was also influenced by changed flow conditions on controlled rivers and to higher heads at new developments. However, tabulations of potential power in Canada are still not complete as many unrecorded rapids and falls of undetermined power capacity exist on rivers and streams throughout the country, particularly in the less-explored northern districts. Apart from cases where definite studies have been carried out and the results recorded, no consideration has been given to the power concentrations that are feasible on rivers and streams of gradual gradient, where economic heads possibly may be created by the construction of dams. Thus the figures in Table 1 of available power, under the two conditions of stream flow, represent only the *minimum* water-power possibilities of Canada.

The third column gives the total capacity of the water wheels actually installed. These figures should not be placed in direct comparison with those in the first and second columns to deduce the percentage of the available water-power resources that has been developed. At developed sites, the water-wheel installation averages 30 p.c. greater than the corresponding calculated maximum available power at the same sites. The figures of Table 1, therefore, indicate that the *at present recorded* water-power resources will permit of a turbine installation of more than 65,000,000 h.p., and that the turbine installation at Dec. 31, 1951, represents approximately only 20 p.c. of recorded water-power resources.

AVAILABLE AND DEVELOPED WATER POWER

(AS AT DECEMBER 31, 1951)

The development from year to year of Canada's water-power resources is a good index of the country's industrial growth and of the change in its economic life since the beginning of the present century. In 1900, prior to the inception of long-distance transmission of electricity, Canada's economy was based largely on agriculture and the total of hydraulic installations, mostly small mills, was only 173,000 h.p. With the successful solution of the problems of transmission of electric energy for use in distant communities, the development of large hydraulic projects became practicable and, by 1910, total installation had risen to 977,000 h.p. In ensuing decades, the growth in installed capacity, partly speeded by war demands, proceeded at an accelerated rate.

Table 2 shows clearly the consistent growth in capacity since the beginning of the century as well as the heavy increases in installation during the war years 1942 and 1943 and during the later post-war years 1948 to 1951. In 1951 more than 780,000 h.p. was added to the total capacity of the country and at the end of the year many new plants and additions were under construction.

2.—Hydraulic Turbine Horse-Power Installed, by Provinces, as at Dec. 31, 1900-51

NOTE.—Figures for each year 1900-30 are given at p. 361 of the 1939 Year Book; for 1931-39 at p. 362 the 1946 edition.

The availability of large amounts of hydro-electric energy has so fostered the economic utilization of the natural products from land, forest and mine that Canada has become a highly industrialized nation. Low-cost power is fundamental in meeting the enormous requirements of the pulp and paper industry—Canada's largest industry and one of the world's great industrial enterprises; it also allows the economic mining, milling and refining of base and precious metals and facilitates their fabrication into a multitude of manufactured articles. Canada's outstanding

growth in the post-war period has been made in conjunction with accelerated development of water-power resources. From hydro-electric plants ranging in capacity from a few hundred to more than 1,000,000 h.p., networks of transmission line carry power to most urban centres and to an increasing number of rural districts. This wide distribution of power has facilitated the decentralization of industry, enabling manufacturing processes to be carried on in many of the smaller centres of population. Economical domestic service, too, contributes in no small measure to the high standard of living enjoyed in Canada.

With a total capacity of 13,342,504 h.p., present water-power plants in Canada, if operated at full load, would produce energy at the rate corresponding to the output of more than 133,000,000 manual workers, on the commonly accepted basis of one mechanical horse-power equalling the working capacity of ten men.

Table 3 shows under three classifications, the purposes for which the developed water power is primarily utilized.

Percentages of total installation.....	89.0	6.5	4.5	100.0

¹ Includes only hydro-electric stations that develop power for sale.

² Includes only water power

actually developed by pulp and paper companies.

³ Includes only water power *actually developed* by industries other than central electric stations and the pulp and paper industries.

⁴ All water wheels and hydraulic turbines installed in Canada.

The central electric station classification totalling 11,875,714 h.p. represents 89 p.c. of the total developed water power as at Dec. 31, 1951. In 1900 the corresponding percentage was 33.5, thus showing the tremendous growth in central electric station installations since the inception of successful long-distance transmission of electricity. Central hydro-electric stations produced nearly 97 p.c. of all electricity sold in or exported from Canada during 1951.

The pulp and paper turbine installation total of 866,177 h.p. includes only water power *actually developed* and directly used by pulp and paper companies. In addition, this industry is the greatest purchaser of central electric station power, buying more than 17 p.c. of all power sold for industrial purposes. Part of the purchased power is classed as secondary, being used for steam generation by electric boilers.

The 'other industries' group develops 600,613 h.p. solely for its own use. These diversified industries also provide a broad market for the power sold by the central electric stations.

The figure of total hydraulic installation in Canada, 13,342,504 h.p., is the cumulative total of all existing installations of water wheels and hydraulic turbines, irrespective of whether or not the equipment has been in use during the year. It has been adjusted to Dec. 31, 1951, by the inclusion of new installations completed during the year and by deletion of those old units which were dismantled. The somewhat similar figures reported by the annual Census of Industry are compiled on a different basis and represent only the sum of the units actually in operation during the year in those plants from which reports were received.

Subsection 2.—Water-Power Developments in 1950 and 1951, by Provinces and Territories

Construction of power plants proceeded vigorously during 1950 and 1951, keeping pace with the expansion of general industrial activity throughout Canada and the consequent increasing demand for electric power. Following the usual trend, the larger part of this construction was concerned with water-power plants, although the building of thermal plants also was active. In the two years, a total of 1,843,525 h.p. of new hydro-electric capacity was brought into operation and, at the end of the period, about 1,700,000 h.p. was under active construction for operation in 1952-53. Approximately the same amount was in the preliminary stages of construction, with operation planned for 1954-55. One striking feature of the present program of development is the number of new projects that are being undertaken in rather remote regions, with the power to be used locally; this fact tends to accentuate the potential value of those undeveloped sites which at present may appear to be so remotely located as to be of little economic importance. The progress of water power developments in each province is outlined below.

Atlantic Provinces.*—During 1950, the Nova Scotia Power Commission completed a development of 12,800 h.p. in two units on the Mersey River at Deep Brook. In 1951, the Commission had under construction, for operation in 1952, a plant of 8,600 h.p. on the Bear River. The Nova Scotia Light and Power Company brought into operation its new Paradise Brook development of 5,000 h.p. and had under construction a new plant of 4,000 h.p. on the Gaspereau River at White Rock. The New Brunswick Electric Power Commission has under construction, for 1953 operation, a development of 27,000 h.p. in two units on the Tobique River. The Newfoundland Light and Power Company in 1951 completed its new plant of 13,000 h.p. on the Mobile River and also a new unit of 3,350 h.p. in its Tors Cove plant; the Company also has under construction a plant of 7,500 h.p. at Cape

* In addition to water-power development, the construction of fuel-electric plants included: Nova Scotia Power Commission enlargement at Cantleys Point by 10,000 kw., with a further addition of 10,000 kw. under construction; Nova Scotia Light and Power Company Limited, 26,000 kw. at Halifax, and a second unit on order; Seaboard Power Corporation Limited, 18,750 kw. at Glace Bay, N.S., and a similar unit on order; New Brunswick Electric Power Commission, 6,250 kw. at Grand Lake, and a similar unit under installation; Maritime Electric Company at Charlottetown, P.E.I., 7,500 kw.; Newfoundland Light and Power Company, a 3,580-h.p. diesel-electric unit on Bell Island.

Broyle for 1952 operation and one of the same capacity on the Horse Chops River for 1953. The Anglo-Newfoundland Development Company Limited is undertaking the modernization of its Grand Falls and Bishop Falls plants on the Exploits River and will increase the capacity of each by 6,000 h.p. In Labrador, the Iron Ore Company began preliminary construction on a development of 12,000 horsepower on the Ashuanipi River for 1954 operation to serve Burnt Creek and Knob Lake.

Quebec.—In Quebec, a total of 703,500 h.p. of *new* hydro-electric capacity was brought into operation during 1950 and 1951. The largest single addition was that of 333,000 h.p. in six units in the Beauharnois No. 2 power-house of the Quebec Hydro-Electric Commission on the St. Lawrence River; ultimate capacity, which may be reached in 1953, is 666,000 h.p. The Commission also has under construction, for 1953 operation, a development of 16,000 h.p. at Rapid II on the upper Ottawa River. The Shawinigan Water and Power Company completed its 325,000-h.p. La Trenché plant on the St. Maurice River; two of its 65,000 h.p. units were brought into operation in 1950 and the other three in 1951. Work has begun towards raising the firm output of the plants on the St. Maurice River by about 30,000 h.p. by diverting water from the head-waters of the Megiscane and Susie Rivers into the St. Maurice basin. In 1951, the Northern Quebec Power Company completed the installation of a new unit of 35,000 h.p. in its Quinze plant on the upper Ottawa River, bringing capacity to 85,000 h.p. The Pembroke Electric Light Company Limited, in 1951, added two units each of 3,000 h.p. to its plant on the Black River at Waltham and the Cie Electrique de Mont Laurier, two units each of 1,350 h.p. to its plant on the Lièvre River. Early in 1950, the city of Rivière-du-Loup replaced a 500-h.p. unit with one of 1,800 h.p. The Aluminum Company of Canada has under construction two developments on the Peribonka River, one at Chute-du-Diable and one at Chute-à-la-Savanne, each of 275,000 h.p. in five units under 110-foot head; initial operation is scheduled for May and September 1952, respectively, and completion of both plants is expected in 1953. Price Brothers and Company Limited began construction in June 1951 of two plants on the Shipshaw River; the main development at Chute-des-Georges will be of 70,000 h.p., in two units under 348-foot head, while the second plant, located below Lake Brocket, will contain one 9,000-h.p. unit under 47-foot head; operation is planned for 1953 and the output will be used in the Company's paper mills. The Manicouagan Power Company began construction in 1951 of a development near the mouth of the Manicouagan River to comprise initially two units, each of 50,000 h.p., for operation in 1953 but with provision for an ultimate installation of 300,000 h.p. The Ste. Marguerite Power Company begun construction of a development of 17,000 h.p. in two units on the Ste. Marguerite River for 1954 operation, principally to serve the Iron Ore Company at Seven Islands. While not increasing their generating capacity, the Gatineau Power Company and the Southern Canada Power Company carried out extensive additions to their transmission and distribution systems. The Quebec Streams Commission carried out storage and power studies on a number of rivers; its storage dam operations were continued with good results in stream regulation on controlled rivers.

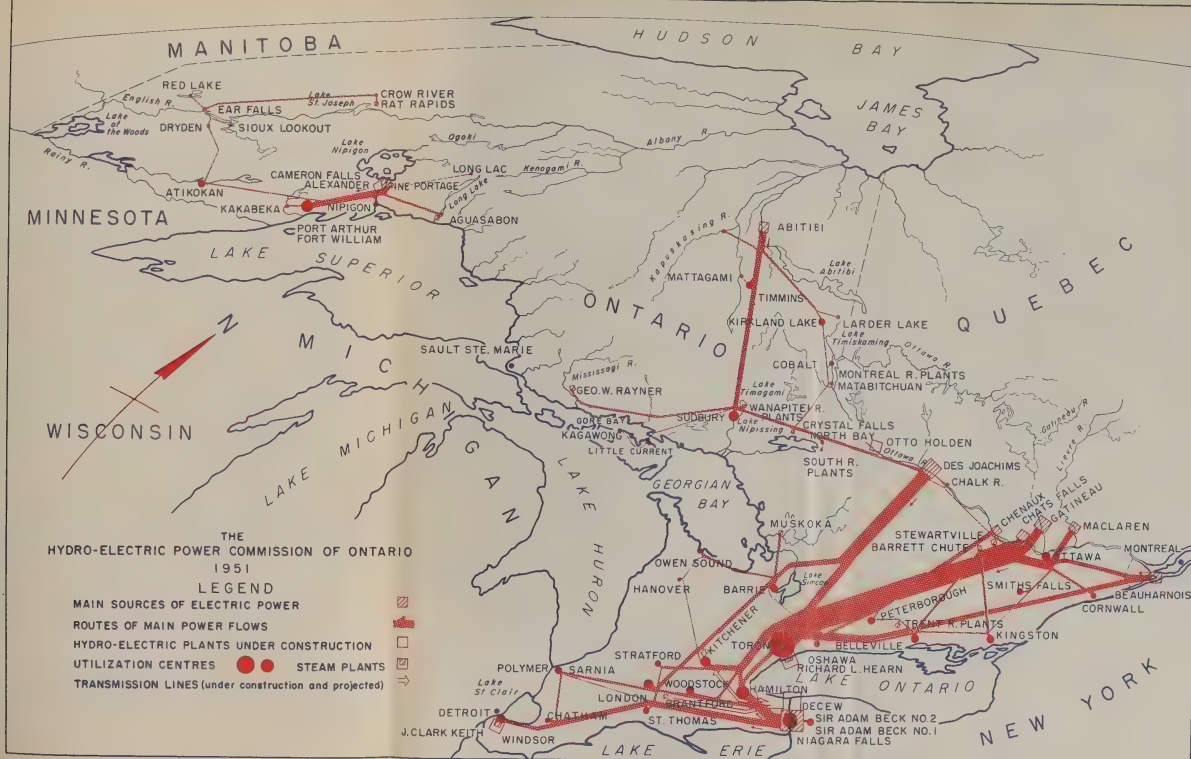

Ontario.*—As a result of the particularly heavy increase in power demand in southern Ontario, the large current construction program of the Hydro-Electric Power Commission of Ontario was vigorously expedited. The Des Joachims and Chenaux developments on the Ottawa River were completed in 1951, the final and eighth unit of 62,000 h.p. being added at the 496,000-h.p. Des Joachims plant and the remaining six units each of 21,000 h.p. at Chenaux, bringing total capacity to 168,000 h.p. At the La Cave development, also on the Ottawa River and now designated "Otto Holden Generating Station", initial operation commenced in June 1952 and completion of the plant of eight units totalling 272,000 h.p. scheduled for December. On the Nipigon River, the Pine Portage development of 82,000 h.p. in two units was completed in 1950, with provision for an ultimate capacity of 164,000 h.p. The development of the "Tunnel" site on the Mississagi River near Thessalon, 58,000 h.p. in two units, was also completed in 1950; this plant has been designated the "George W. Rayner Generating Station". On the Niagara River at Queenston, preliminary construction was actively begun in 1951 for the Sir Adam Beck-Niagara Generating Station No. 2 which will contain seven units totalling 735,000 h.p. with initial operation scheduled for 1954. The water from the upper river will be conveyed by a tunnel 45 feet in diameter with a length of 28,600 feet and by a canal 200 ft. wide and 11,800 feet long. Excavation for the power-house, for the canal, and for the access shafts to the tunnel were well advanced at the end of 1951.

In addition to the activities of the Hydro-Electric Power Commission of Ontario, the town of Orillia completed its development of 3,750 h.p. on the south branch of the Muskoka River near Mathiasville. The Great Lakes Power Company brought into operation a new unit of 13,200 h.p. in its High Falls plant on the Michipicoten River and had under construction for operation in 1952 a new plant of 15,000 h.p. to be located at Scott Falls, a short distance downstream from the present station. The Abitibi Power and Paper Company had under way for some time a modernization program in its Iroquois Falls plant on the Abitibi River which resulted in an increase in capacity of 4,350 h.p.; the plant is now rated at 32,350 h.p.

Prairie Provinces.†—The Manitoba Hydro-Electric Board made good progress on its Pine Falls development on the lower Winnipeg River—two units, each of 19,000 h.p., were brought into operation in December 1951 and the plant of 114,000 h.p. was scheduled for completion in 1952. The Winnipeg Electric Company brought into operation, in August 1950, the fifth unit of 37,500 h.p. in its Seven Sisters plant and had under installation, for operation in 1952, the sixth and final unit; to allow efficient operation of this plant, the Pinawa channel was being closed

* To supplement its power output from hydro-electric plants, the Hydro-Electric Power Commission of Ontario is constructing steam-electric plants at Windsor and Toronto with capacities of 264,000 kw. and 400,000 kw., respectively. At Windsor, the first unit of 66,000 kw. was brought into operation in November 1951, the second and third will follow in 1952 and the plant will be completed in 1953. At Toronto one 25-cycle 88,000-kw. unit and one 60-cycle 100,000-kw. unit were completed in 1951 and similar units were scheduled for operation by early 1953; ultimately the 25-cycle units will be converted to 60-cycle operation at 100,000-kw. capacity.

† The Saskatchewan Power Corporation completed the installation of a new steam turbo-generator of 15,000 kw. in its Estevan plant and was enlarging its Prince Albert plant by 10,000 kw. and its Saskatoon plant by 25,000 kw., for operation in 1952. The City of Winnipeg is building an auxiliary steam plant with one unit of 15,000 kw. to be installed in 1952 and an additional 25,000 kw. in 1953.

and the Company's Pinawa plant of 37,800 h.p. dismantled. Sherritt-Gordon Mines Limited was proceeding with the development of 7,000 h.p. on the Laurie River to serve the Lynn Lake area and operation of the two-unit plant was scheduled for the summer of 1952. During 1950 and 1951, the Manitoba Power Commission extended service to about 10,000 farms and to an additional 70 rural communities.

No new developments were made in Saskatchewan but, in Alberta, installed capacity of water-power plants was practically doubled in 1951 with the completion by Calgary Power Limited of the Spray Lakes storage and diversion scheme which involved three new plants: Three Sisters, 3,600 h.p.; Spray, 62,000 h.p.; and Rundle, 23,000 h.p. A new unit of 12,000 h.p. was also installed in the Kananaskis plant on the Bow River, as flow conditions were improved by Spray storage.

British Columbia.—The British Columbia Power Commission brought into operation a new development of 33,000 h.p. in two units under 710-foot head on the Whatshan River, provision being made for an ultimate capacity of 66,000 h.p. The Commission has under construction for operation in 1952 a plant of 4,000 h.p. on the Clowhom River, is extending its John Hart plant on the Campbell River for 1953 operation by two units, each of 28,000 h.p., and is planning a development on the Quesnel River. The British Columbia Electric Company Limited completed the installation of a third unit of 47,000 h.p. in its Ruskin plant and remodelled its Lake Buntzen No. 1 plant by replacing its seven old units with one new unit of 70,000 h.p., an increase of 41,800 h.p. The Company has under construction for operation in 1952 a new development of 82,000 h.p. in one unit under 2,000-foot head on Wahleach Lake, about 15 miles east of Chilliwack; it is also adding a fourth unit of 62,000 h.p. in its Bridge River plant for 1953 operation and is undertaking the modernization of its Jordan River plant, with an increase in capacity of about 4,000 h.p. The Aluminum Company of Canada in 1951 began preliminary construction on its Nechako-Kitimat development which involves the diversion of the head-waters of the Fraser River by tunnel through the coastal range; present plans call for an installation of 420,000 h.p. by 1954, with provision being made for a total installation of about 1,000,000 h.p. The Consolidated Mining and Smelting Company of Canada Limited has commenced construction of a development of 205,000 h.p. in two units under 210-foot head on the Pend d'Oreille River, near its junction with the Columbia River; operation is scheduled for early 1954. The following smaller developments were completed: Mastodon Zinc Mines Limited, 1,000 h.p. on La Forme Creek near Revelstoke; Western Uranium-Cobalt Mines Limited, 800 h.p. on Juniper Creek near Skeena Crossing; Ashcroft Water and Electric Company, 325 h.p. on Bonaparte River; Gilley Brothers Limited, replacement of an old 500-h.p. water wheel by a 550-h.p. hydro-electric unit.

Yukon Territory.—In Yukon, the Northwest Territories Power Commission is constructing, for 1952 operation, a development of 3,000 h.p. on the Mayo River to serve the mines in the Keno Hill and Galena Hill areas.

Section 2.—The Central Electric Station Industry

Central electric stations are companies, municipalities or individuals selling or distributing electric energy, whether generated by themselves or purchased for resale. Stations are divided into two classes according to ownership, viz., (1) commercial—those privately owned and operated by companies or individuals, and

(2) municipal—those owned and operated by municipalities or provincial governments. These are subdivided according to the kind of power used into (a) hydraulic, (b) fuel, and (c) non-generating. This last sub-class purchases practically all the power it resells; a few of these stations have generating equipment that is held for emergencies. The hydraulic stations contain water turbines and wheels with approximately 87 p.c. of the total capacity of hydro installations in all industries in Canada. The generators driven by this hydraulic equipment generate 97 p.c. of the total output of all central electric stations.

4.—Electric Energy Generated, by Type of Station, 1941-50, and by Provinces, 1949 and 1950

Year and Province	Generated by—		Total	Year, Province or Territory	Generated by—		Total

Subsection 1.—Statistics of Central Electric Stations*

The growth of the central electric station industry has been practically continuous since 1919, when statistics of kilowatt hours generated were first made available. Minor hesitations in output occurred in years of recession but the general movement has been strongly upward and, based on monthly data, the output of central stations during 1951 was more than ten times that of 1919. Ample electric power at reasonable rates has been a principal factor in the transformation of Canada over the past half century from a predominantly agricultural to an industrial nation.

The central electric station industry is one that is particularly suited to large-scale operation because of the huge outlay of capital necessary. Capital invested and total horsepower installed increased almost continuously even during the

* Revised in the Public Finance and Transportation Division, Dominion Bureau of Statistics.

depression years, mainly because large power projects planned before the depression were in process of construction. Expansion since the end of World War II has been spectacular and large additional developments are currently under way (see pp. 554-569). Installed capacity of the industry in hydro and thermal units is now about equal to one horsepower for every Canadian.

OUTPUT OF CENTRAL ELECTRIC STATIONS

1928-51

5.—Summary Statistics of Central Electric Stations, 1941-1950

NOTE.—Figures for the years 1917-31 will be found at p. 369 of the 1940 Year Book; f or 1932-40 figures see p. 564 of the 1950 edition.

Year	Stations	Capital Invested	Revenue from Sale of Power ¹	Power Equipment Capacity ²	Kilowatt Hours Generated	Customers	Persons Employed	Salaries and Wages

Domestic Service.—The power used by domestic customers or for residential purposes amounts to over 14 p.c. of the total production of central electric stations. Details of the number of domestic customers served, the kilowatt hours delivered and the costs to the customers, exclusive of direct federal, provincial and municipal taxes on such service, are shown in Table 7. The average consumption per customer and average cost per kilowatt hour vary considerably as between municipalities and also as between provinces, but the differences in the average bills are smaller. The availability of low-cost power to domestic users contributes greatly to the high standard of living enjoyed in Canada.

7.—Summary Statistics of Domestic Consumption of Electricity, 1941-50

Year	Customers	Consumption	Average Consumption per Customer	Average Charge per Annum	Average Charge per kwh.

Farm Service.—Table 8 shows the number of farm customers, the average annual consumption, average annual revenue and the average revenue per kilowatt hour sold to these customers in each province in 1950. Rural electrification has made considerable progress since the end of World War II. Farm customers added during 1950, totalled 52,861 and the national total at 303,727 increased by 21·1 p.c. over 1949. The relatively large number of farm customers in Ontario and the low average revenue per kilowatt hour is evidence of the assistance given in this field by the Ontario Government. It is estimated that over 48 p.c. of the farms in Canada now enjoy the benefits of power-line service. Many additional farms generate their own electricity by the use of engines, windmills, etc.

8.—Farm Service Furnished by Central Electric Stations, 1949 and 1950

NOTE.—Farm service was not reported separately in Newfoundland, Yukon Territory or the Northwest Territories.

Equipment of Central Electric Stations.—Auxiliary equipment includes only thermal engines and generators operated by them in hydraulic stations and in non-generating plants and does not include spare equipment in thermal stations or spare hydraulic equipment in hydraulic stations. Such equipment is classed as main-plant equipment. The capacities of the equipment are the manufacturers' ratings and, for water wheels and turbines, the kilowatt hour capacities vary with the supply of water. The majority of the hydraulic stations are large, serving wide areas over transmission lines, whereas most of the plants with thermal engines are small, serving the needs of the local municipality. The number of thermal engines increased from previous years. Equipment data were not included for small industries or firms, mainly in Saskatchewan and Alberta, whose output was largely consumed by their own plants.

9.—Main-Plant Equipment of Central Electric Stations, by Provinces, and Total Auxiliary Equipment, 1949 and 1950

NOTE.—Kva. means kilo-volt-amperes.

Export and Import of Electric Power.—Electric energy is exported from Canada only under licence and an export tax of 0.03 cents per kilowatt hour is levied with some exceptions. The export duties for the years ended Mar. 31, 1948 to 1950, were \$470,627, \$435,867 and \$431,895, respectively.

Exports for the years 1948-51 are shown in Table 10. There are also large interprovincial movements of electric energy from Quebec to Ontario, and smaller movements from Quebec to New Brunswick, Manitoba to Ontario, Saskatchewan to Manitoba and British Columbia to Alberta.

The water allowed to be diverted at Niagara Falls for power purposes was increased by 5,000 cu. ft. per second to the Canadian side in November 1940, owing to a diversion of water from Long Lake and the Ogoki River from the James Bay watershed to the Great Lakes watershed. In 1941 a further increase of 9,000 c.f.s. to the Canadian plants and 12,500 c.f.s. to the United States plants was permitted, and in 1943 an additional 4,000 c.f.s. to Canadian plants, bringing the totals up to 54,000 c.f.s. for Canada and 32,500 c.f.s. for the United States. This increased water, with greater development of plants on the St. Lawrence River, made possible the increased export of both firm and secondary power to the United States (5,000 c.f.s. will produce about 150,000 h.p. at the Queenston, Ont., plant). During 1948 and 1949 increased demands from domestic consumers and low water reduced the surplus energy available for export but exports increased again in 1950 and 1951.

Subsection 2.—Ownership and Regulation of Central Electric Stations*

Water power is developed in Canada by provincial commissions, by municipalities and by private companies—hydro-electric plants. The first such provincial commission was formed in Ontario in 1906 to act as trustee for a group of municipalities to develop and distribute electricity. The Hydro-Electric Power Commission of Ontario now generates and purchases power, transmits it to rural and urban municipalities and serves large power customers. Similar commissions have been formed in most of the other provinces.

* The information included under the provincial headings of this Subsection has been revised by the various provincial commissions or authorities concerned.

¹ Includes Newfoundland.

A large portion of the power development in Quebec is connected with pulp and paper plants and with the aluminum industry. Such power plants are operated as separate organizations and deliver power to the parent companies at relatively low rates. Substantial blocks of power are also produced in Quebec for export to Ontario.

Table 12 shows statistics of municipally or publicly owned central electric stations, by provinces, for 1949 and 1950. Table 14 shows comparable statistics for commercial stations.

¹ Includes Newfoundland.

The predominant position of Quebec in the electric-power field can be seen from the figures of Table 14. Of the total power generated in Canada by all central electric stations in 1950, 43 p.c. was generated by privately owned or commercial stations in the Province of Quebec; this percentage decreased from 57 in 1943 as a result of the transfer, in 1944, of the Montreal Light, Heat and Power Company and the Beauharnois Power Company to the publicly owned Quebec Hydro-Electric Commission.

In 1950, all stations in Ontario produced less than one-half as much power as the Quebec stations and only 13 p.c. of the total for Ontario stations was produced by privately owned stations.

Because of the absence of free market determination of prices and regulation of services in an industry that is semi-monopolistic, regulation of electrical utilities has been attempted in most provinces. The governing bodies of the provincial electric-power commissions, their functions and activities are summarized by provinces in the following paragraphs. In certain cases, privately owned utilities are also covered.

Newfoundland.—There are no publicly owned hydro-electric systems in Newfoundland. Of the total installed turbine capacity of 292,890 h.p. at the end of 1951, 245,550 h.p. was utilized by the two large pulp and paper companies—Anglo-Newfoundland Development Company Limited and Messrs. Bowater's Newfoundland Pulp and Paper Mills Limited—for their own manufacturing requirements and for the provision of light and power to the municipalities in their vicinities. The remainder was distributed among four other privately owned companies, the largest being the Newfoundland Light and Power Company which supplies the City of St. John's and the town of Bell Island together with the mining operations there. This Company has a turbine installation of 37,900 h.p. at five plants all on the eastern side of the Avalon Peninsula to which a proposed development at Horse Chops River, Cape Broyle, will add 8,500 h.p. One municipally owned steam plant, with a capacity of 264 h.p., operates at the town of Lewisporte.

Nova Scotia.—Legislation relating to the use of water power was first enacted in Nova Scotia in 1909 under "An Act for the Further Assistance of the Gold Mining Industry". In 1914, legislation was passed initiating the development of water power in the Province and this was carried on in an investigatory manner in co-operation with the Federal Government until 1919 when the Nova Scotia Power Commission was created under the Power Commission Act. Certain investigatory work is still carried on in Nova Scotia by the Federal Government in close association with the Commission. The control of the water resources of the Province is vested in the Crown and is administered under the provisions of the Nova Scotia Water Act of 1919. The Commission pays the regular fees for water rights.

The function of the Commission is to supply electric power and energy by the most economical means available. The Rural Electrification Act of 1937 greatly increased the possibilities for retail service by providing for financial assistance to equalize cost and revenue of extensions, the construction of which has been approved by the Governor in Council as qualifying under the Act. In 1941, an amendment to the Power Commission Act authorized the Commission, subject to the approval of the Governor in Council, to regulate and control the generation, transmission, distribution, supply and use of power in the Province.

Financially, the Commission is self-supporting, repaying borrowings from revenue. The balance sheet at Nov. 30, 1950, showed total fixed assets of \$29,266,677, including work in progress amounting to \$4,638,804. Current assets amounted to \$325,550. Liabilities are shown as follows: fixed \$23,088,483; current \$1,927,044; contingency and renewal reserves \$2,884,464; sinking fund reserves \$4,566,241; and general reserves and special reserves \$1,595,944.

The initial development of the Commission was an 800 h.p. installation on the Mushamush River which went into operation in 1921 and delivered 192,000 kwh. in the first complete year of operation. Succeeding years showed a marked growth in installed capacity, reaching 92,450 h.p. in hydraulic turbines, 2,012 h.p. in diesel units and 1,125 kw. in steam turbines by Nov. 30, 1950, with a total generation for that year of 253,058,860 kwh.

The territory of the Commission extends the entire length of the Province and embraces nine systems which include 22 generating stations and 3,426 miles of transmission and distribution lines, through which 44 wholesale and 21,919 retail customers received 242,467,861 kwh. during the year ended Nov. 30, 1950.

The installed capacity and annual output of the various systems of the Nova Scotia Power Commission are given in Table 15. The Commission had under construction a plant of 8,600 h.p. on the Bear River scheduled for operation in 1952.

15.—Capacity and Output of the Nova Scotia Power Commission, 1950

New Brunswick.—The New Brunswick Electric Power Commission was incorporated under the Electric Power Act, 1920. Generating stations owned and operated by the Commission are as follows:—

<i>Plant</i>	<i>Type</i>	<i>Capacity</i>	<i>Plant</i>	<i>Type</i>	<i>Capacity</i>
		h.p.			h.p.
Musquash.....	Water power.....	10,000	St. Stephen.....	Diesel.....	2,500
Grand Lake.....	Steam.....	43,550	Campobello.....	Diesel.....	335
Saint John.....	Steam.....	25,500	Andover.....	Diesel.....	535
Chatham.....	Steam.....	16,750	Shippegan.....	Diesel.....	2,680
Grand Manan.....	Diesel.....	1,045			
St. Quentin.....	Diesel.....	950	TOTAL CAPACITY.....		103,845

The Musquash, Grand Lake, Saint John and Chatham plants are interconnected and operate in parallel at all times. The St. Stephen and Shippegan plants also may be paralleled with the system as required.

A new steam plant was placed in operation at Grand Lake in the autumn of 1951, adding 16,750 h.p. to the Commission's generating capacity. A 25,000 h.p. unit will be in service in this same plant late in 1952.

High-voltage transmission was increased from 646 miles in 1949 to 694 miles in 1951. Power is sold "en bloc" to the cities of Saint John, Moncton and Fredericton and to the town of Sussex.

The statistical information given in Table 16 shows the growth of the Commission's undertakings since 1924.

² Estimate.

Quebec.—*The Quebec Streams Commission.*—Created by S.Q. 1 Geo. V, c. 5, and given additional powers by 3 Geo. V, c. 6 (R.S.Q. 1925, c. 46) and 20 Geo. V, c. 34, the Quebec Streams Commission was authorized to ascertain the water resources of the Province, to make recommendations regarding their control, and to construct certain storage dams and operate them so as to regulate the flow of streams. It has assisted companies engaged in such work by the systematic collection of data on the flow of the principal rivers and on meteorological conditions, by investigation of numerous water-power sites and determination of the longitudinal profile of a large number of rivers, but mainly by the regulation of the flow of the principal power streams through the construction of storage dams.

From 1912 to 1925, a number of storage reservoirs were built or acquired by the Commission, charges being made to benefiting companies to cover interest and amortization on the capital invested as well as the cost of operation. Since 1925, companies or persons have availed themselves of the latitude given them by R.S.Q. 1925, c. 46, to build the necessary dams; such storages have been transferred to and are operated by the Commission, the cost of operation only being charged annually to the interested companies or persons. The Commission now controls and operates 28 storage-reservoirs in the Province.

Among the rivers controlled by the Commission, either by means of dams on the rivers or by controlling the outflow of lakes at the head-waters, are: the St. Maurice, now developing 1,110,550 h.p.; the Gatineau, 523,000 h.p.; the Lièvre, 274,000 h.p.; the St. Francis, 100,000 h.p.; the Chicoutimi, 41,400 h.p.; the Au Sable, 33,200 h.p.; and the Metis, 15,700 h.p. The Commission also operates nine reservoirs on Rivière du Nord, two in the watershed of the Ste. Anne-de-Beaupré River, and one at the outlet of Lake Morin, on Rivière-du-Loup (en bas).

Reservoirs not Controlled by the Quebec Streams Commission.—Among storage-reservoirs not controlled or operated by the Commission are: the Lake St. John, the Lake Manouane and Passe Dangereuse on the Peribonca River, and the Onatchiway on the Shipshaw River; the Témiscouata Lake on Madawaska River, controlled by the Gatineau Power Company; Memphremagog Lake on the Magog

River, controlled by the Dominion Textile Company; Témiscamingue and Quinze Lakes on the Ottawa River, controlled by the Federal Department of Public Works; Kipawa Lake on the Ottawa River, controlled by the Gatineau Power Company; and Dozois Lake on the Upper Ottawa River, controlled by the Quebec Hydro-Electric Commission.

Power developments on the Saguenay River, benefiting from the Peribonca and Lake St. John reservoirs, amount to 1,950,000 h.p. since the Chute-à-Caron (Shipshaw) project has been completed.

The Quebec Hydro-Electric Commission.—The Quebec Hydro-Electric Commission was established by S.Q. 8 Geo. VI, c. 22, with the object of supplying power to the municipalities, industrial or commercial undertakings and to citizens of the Province of Quebec at the lowest rates consistent with sound financial administration.

On Apr. 15, 1944, in accordance with the provisions of this Act, the Commission took over: (a) the system of Montreal Light, Heat and Power Consolidated for the generating and distribution of electricity; (b) the undertaking of the Montreal Island Power Company for the generating and distribution of electricity; and (c) all the shares of the capital stock of the Beauharnois Light, Heat and Power Company. Thus, the Quebec Hydro-Electric Commission now controls, among other assets, the following hydro-electric plants:—*

<i>Hydro-Electric Plant</i>	<i>River</i>	<i>Installed Capacity</i> h.p.
Cedars.....	St. Lawrence.....	200,000
Chambly.....	Richelieu.....	9,000
Sault-au-Recollet.....	Rivière-des-Prairies.....	45,000
Beauharnois.....	St. Lawrence.....	1,030,000
Rapid VII.....	Upper Ottawa.....	64,000

The Commission operates a public utility system which supplies electric light and power requirements to Greater Montreal and surrounding districts, embracing a population of nearly 1,500,000. From the Cedars plant, electric energy is supplied to the Aluminum Company of America at Massena, N.Y., and through Beauharnois Light, Heat and Power Company power is sold to the Hydro-Electric Power Commission of Ontario. Sales involved are in the neighbourhood of rates of 100,000 h.p. to Massena, N.Y., and 250,000 h.p. to Ontario.

* The Commission also purchases 160,000 h.p. from the Shawinigan Water and Power Company.

17.—Growth of the Quebec Power Systems, 1942-51

NOTE.—Figures for the years 1935-41 will be found at p. 572 of the 1950 Year Book.

Year	Municipalities Served	Customers Served	Power Distributed	
			Total	Primary
	No.	No.	h.p.	h.p.
1942.....	61	289,038	1,032,000	827,000

Shawinigan System.....	—	—	—	—	—	8,000
Totals.....	947,000	980,000	1,034,000	1,119,000	1,182,000	1,312,000

In addition to the ownership and operation of these generating and distributing systems, the Quebec Hydro-Electric Commission administers the 64,000 h.p. Upper Ottawa River plant at Rapid VII and also the Dozois Reservoir. Average primary power statistics for this Northern Quebec System (Cadillac-Noranda district) are as follows: 1946, 15,750 h.p.; 1947, 18,140 h.p.; 1948, 21,270 h.p.; 1949, 34,790 h.p.; 1950, 35,500 h.p.; and 1951, 30,550 h.p.

Ontario.—The Hydro-Electric Power Commission of Ontario is a corporate body administering a province-wide co-operative enterprise to produce and distribute electric power. The members of the Commission, a Chairman and two Vice-Chairmen, are appointed by the Lieutenant-Governor in Council to hold office during pleasure. One Commissioner must be a member, and two may be members, of the Executive Council of the Province of Ontario.

The Commission was created in 1906 by an enactment of the Ontario Legislature, after consideration of recommendations made by advisory commissions which had been appointed in response to public demand that the water powers of Ontario should be conserved and developed for the benefit of all the people of the Province.

The Commission operates under the authority of the Power Commission Act (S.O. 7 Ed. VII, c. 19) passed in 1907 as an amplification of the Act of 1906 and subsequently modified by numerous amending Acts (R.S.O. 1950, c. 281). It is a separate entity, a self-sustaining public concern endowed by the Power Commission Act with broad powers to produce, buy and distribute electricity, and to perform certain regulatory functions with respect to the activities of the electrical utility commissions of the member municipalities. The enterprise represented by the Commission is generally known and referred to as the Ontario Hydro.

The Year Book 1940 contains a general article on the Ontario Hydro, to which reference has been made in succeeding editions. It deals with the early history of The Hydro-Electric Power Commission of Ontario from its founding in 1906 and sketches the later development of the Commission both in organization and resources which followed the lines so well established by the first Chairman, Sir Adam Beck.

The undertaking initially proposes to purchase a block of 100,000 h.p. from the Ontario Power Company Limited at Niagara Falls and to distribute this to thirteen municipalities which had signed the original contracts with the Commission to take power at cost. In 1909 the task of constructing a transmission system to distribute power to the member municipalities was begun, and, by the end of the following year, power was being supplied to several of them. Similarly,

and at about the same time, the Commission built a short transmission line and a substation to serve Port Arthur with power purchased from the Kaministiquia Power Company. These two pioneer systems eventually grew into the Southern Ontario and Thunder Bay Systems, respectively.

In 1911 the Severn System was established and, in the years following, other systems were established to serve groups of municipalities in various sections of the Province. By 1919 the number of systems had reached eleven, where it remained until 1924 when the Severn and two other systems were consolidated to form the Georgian Bay System. In 1929-30 a further consolidation of four systems created the Eastern Ontario System. During the 1930's the Commission undertook to operate, in trust for the Provincial Government, what have been known as the Northern Ontario Properties. These were a group of systems which mainly served mining and pulp and paper industries but which were not interconnected. In 1944 the Southern Ontario System came into being through the consolidation of the former Niagara, Georgian Bay and Eastern Ontario Systems.

In 1914 the Commission purchased its first generating station, Big Chute on the Severn River. Later in the same year, the first Commission-built generating station at Wasdells Falls, also on the Severn River, was placed in service. The program of purchase and construction of generating stations thus launched reached its climax between 1917 and 1925 in the construction of the great Queenston-Chippawa development, recently renamed Sir Adam Beck-Niagara Generating Station No. 1, which first delivered power early in 1922. Yet, commencing four years later, the Commission found it necessary to negotiate for the extensive purchase of power from large Quebec suppliers in order to satisfy Ontario's steadily growing demand.

During the three decades between 1921 and 1951 the population of Ontario, as measured at decennial censuses, increased by 17 p.c., 10.4 p.c. and 21.4 p.c. Measured against these very satisfactory rates of increase, the growth of Ontario Hydro has been phenomenal. In 1921 the capital investment of the Commission and its member municipalities was about \$151,000,000. By 1931, it had more than doubled; by 1941, it exceeded \$481,000,000; and by 1951, midway in the current program of expansion, it exceeded \$1,200,000,000. In 1931, the Commission generated and purchased 4,600,000,000 kwh. of electric energy. Corresponding totals for 1941 and 1951 were 10,700,000,000 kwh. and 18,800,000,000 kwh. The dependable peak capacity of the generating stations owned or operated by the Commission rose from 314,400 kw. in 1921, to 820,500 kw. in 1931, to 1,054,800 kw. in 1941, and to 2,237,550 kw. in 1951.

June 1, 1951, was the thirtieth anniversary of the coming into force of the Rural Hydro-Electric Distribution Act. Since 1921 the Commission has vigorously pressed its rural electrification program, assisted by Provincial Government grants in aid of construction of rural distribution facilities. In 1931 the Commission served 54,280 rural customers, in 1941 it served 131,254 and at the close of 1951 it served 318,606. The introduction in 1944 of a uniform rate plan for rural service throughout the Province was a significant event in the latter decade. The number of farms served during 1951 was 85 p.c. of the total number of Ontario farms as calculated on 1951 Census returns. In 1951 the Commission spent \$20,300,000 on its rural program, of which the Provincial Government's share was \$10,000,000.

The rapid growth in power demand that has marked the past decade has taxed the power resources of the Commission to the full. It has been matched by remarkable achievements in the construction of new, and the extension of existing

generating stations. Among recent notable hydro-electric developments have been three major generating stations on the Ottawa River—Des Joachims, Chenaux, and Otto Holden—Pine Portage serving Thunder Bay, and George W. Rayner Generating Station in Ontario's northeastern mining area. The construction of two major fuel-electric generating stations at Toronto and Windsor, named for Richard L. Hearn and J. Clark Keith, respectively, marks a departure from the Commission's virtually complete reliance on hydraulic resources. A summary of the Commission's power development program appears in Table 20.

At present the major capital undertaking, made possible by the Niagara Treaty of 1950, is the construction of the Sir Adam Beck-Niagara Generating Station No. 2 near Queenston on the Niagara River. Plans call for an ultimate installation of 900,000 kw. in 12 units. The first stage, seven units, is expected to be completed in 1955. The best answer to the need for power beyond that year is the St. Lawrence power project.

In 1949 the Commission embarked on a complex program of standardizing at 60 cycles the frequency of the Southern Ontario System. Approximately 33 p.c. of the area comprising the so-called "25-cycle island" had been standardized by 1951. A comprehensive article on this subject appears in the Year Book 1951, pp. 540-548.

The basic principle governing the financial operations of the Commission is that electrical service is provided to the municipalities, and by the municipalities to the customers, at cost. Cost includes not only all operating and maintenance charges interest on capital investment, and reserves for depreciation, for contingencies and obsolescence, and for stabilization of rates, but also a reserve for a sinking fund to retire the Commission's capital debt.

From its inception, the undertaking has been entirely self-supporting with the exception that the Provincial Government, through grants-in-aid, provides for 50 p.c. of the capital cost of the rural distribution lines. This is done in pursuance of the Province's long-established policy of assisting agriculture. The Province also guarantees the payment of principal and interest of all bonds issued by the Commission and held by the public.

With a few exceptions all townships and 150 of the smaller villages are now served as an amalgamated rural division of Hydro service with a uniform rate structure. Thus, no matter where rural service is supplied in Ontario by Hydro, all rural customers pay the same amount for the same class of service with the same consumption of electricity.

The undertaking as a whole involves two distinct phases of operations. The *first* phase of operations is the provision of the power supply—either by generation or purchase—and its transformation, transmission and delivery in *wholesale* quantities to individual municipal utilities, to large industrial customers and to rural power districts. This phase of the operations is performed by The Hydro-Electric Power Commission of Ontario. The *second* phase of operations is the *retail* distribution of electric energy to customers within the limits of the areas served by the various municipal utilities and throughout the rural areas of the

Province. For the consolidated rural power districts, the Commission not only provides the power wholesale but also, on behalf of the respective townships, attends to all physical and financial operations connected with the retail distribution of energy to the customers within the rural operating areas into which the consolidated rural power districts are divided for administrative purposes.

In cities, towns, many villages, and certain thickly populated areas of townships, retail distribution of electric energy provided by the Commission is, in general, conducted by municipal commissions under the general supervision of The Hydro-Electric Power Commission of Ontario, as provided for in the Power Commission Act and the Public Utilities Act.

The total assets of the Commission at Dec. 31, 1951, amounted to \$1,036,029,755. This is the sum of the assets of the Commission in the Southern Ontario and Thunder Bay Systems and the Northern Ontario Properties after deducting accumulated depreciation of \$116,945,857. Rural assets under administration at the end of the year amounted to \$127,227,145, of which \$63,015,165, provided by the Province of Ontario in the form of grants-in-aid, is excluded from the total assets figure given above. The municipal electrical commissions had assets amounting to \$329,051,074, of which \$118,269,171 represented an equity in the Commission's systems.

The following tables give statistics of resources generated and purchased, development program, distribution and service of the Commission. In 1950 the Commission changed its fiscal year (formerly ended Oct. 31) to coincide with the calendar year. Thus, data shown for the year 1950 cover the 14 months ended Dec. 31, 1950, while those for the year 1951 were for the 12 months of that year. All year-end statistics for 1950 and 1951 relate to the months of December for the respective years while those for years previous to 1950 are for the month of October of the given year. Demands for primary power usually reach their seasonal maxima in December.

19.—Resources Generated and Purchased—All Systems, as at December 1950 and 1951

¹ Dependable peak capacity—the amount of power subject to periodic change as equipment and water conditions vary, which the source is expected to be able to supply at the time of the system's peak demand. For the Commission-owned or -operated generating stations, it is presumed that all units are available and that the supply of water is normal. Contractual stipulations govern the capacities of sources of purchased power.

Manitoba.—The Manitoba Power Commission was established in 1919 for the purpose of distributing electric energy, both wholesale and retail, throughout the Province, with the exception of the Greater Winnipeg area. The utility currently operates under authority of an Act respecting the Manitoba Power Commission (R.S.M. 1940, c. 166) and amendments.

The Commission's supply of electric energy for distribution is purchased from the Winnipeg Electric Company at various points, chiefly at or near the City of Winnipeg. Arrangements for the Commission's purchase of power are contained in the Seven Sisters Agreement of 1928 between the Province of Manitoba and the Winnipeg Electric Company. The Commission has gradually acquired practically all of the municipally owned and privately owned generating plants operating within its jurisdiction and has spread a network of transmission lines across the Province. All energy distributed is now generated by hydro power.

The Commission's program, started in the 1930's and designed to bring hydro-electric power at uniform service rates to all urban centres of 20,000 or over population, is now virtually complete and currently serves 419 such centres. In 1942, the Manitoba Electrification Enquiry Commission was appointed by the Provincial Government to study the feasibility of widespread farm electrification in the Province. It was concluded that, with the Manitoba Power Commission's network of transmission lines as a source of supply and with the economy in design of farm lines that had been worked out, it would be practicable to bring the benefits of hydro-electric power to over 90 p.c. of the farms in the Province, provided the farmers themselves were prepared to assist in certain organizational and operational matters. A test program undertaken in 1945 proved successful and thereafter the Commission conducted annual programs of farm electrification. Shortages of materials restricted the size of these programs until 1948 when the set goal of 5,000 farm connections was reached. The program has since continued on an area-coverage basis and the Commission now serves over 27,000 farms and has plans for further coverage.

Saskatchewan.—The Saskatchewan Power Corporation, established Feb. 1, 1949, and operating under the provisions of the Power Corporation Act 1950 (Statutes of Sask. 1950, c. 10), as amended, succeeds the Saskatchewan Power Commission which operated from Feb. 11, 1929, to Jan. 31, 1949. During the years 1929-49, the Commission purchased a number of generating plants and constructed and purchased transmission lines and also distribution systems in certain urban centres.

In 1945 it purchased the assets of Prairie Power Company Limited and in 1947 purchased the assets of Canadian Utilities Limited in Saskatchewan. It absorbed into its system the assets in Saskatchewan of Dominion Electric Power Limited, which for a time had been operated by the Commission as a wholly owned subsidiary.

The main functions of the Saskatchewan Power Corporation are the generation, transmission, distribution, sale and supply of electric energy and steam. It is also authorized to produce or purchase, and to transmit, distribute, sell and supply natural or manufactured gas, but as yet has not exercised its powers in relation to gas.

Particulars of the operations of the Saskatchewan Power Commission from 1929 to 1948 and of the operations of the Saskatchewan Power Corporation during 1949 are given in the 1951 Year Book and earlier editions.

At the end of 1951, the Corporation owned and operated 8,757 miles of transmission line and distribution systems at 537 urban centres. It also owned and operated steam-generating plants at Estevan, North Battleford, Prince Albert and Saskatoon with a total installed capacity of 76,950 kw., and diesel-generating plants at Assiniboia, Biggar, Canora, Davidson, Hudson Bay, Humboldt, Kindersley, Leader, Maple Creek, Meadow Lake, Melfort, Melville, Moosomin, Nipawin, Shaunavon, Shellbrook, Swift Current, Tisdale, Unity, Watrous, Wynyard and Yorkton, with a total installed capacity of 30,053 h.p. During 1950 and 1951, the Corporation purchased blocks of power from the City of Regina and the National Light and Power Company Limited, Moose Jaw. During the same years the Corporation sold electric energy in bulk to the Cities of North Battleford, Saskatoon and Swift Current, and to the Town of Battleford. The number of customers served by these municipalities was 21,223 at the end of 1951. All the other urban centres on the Corporation's system were supplied on a retail basis, the number of customers so served by the Corporation being 72,700. At the end of 1951, the Corporation purchased the distribution system owned by the City of North Battleford and now supplies that city and its inhabitants on a retail basis.

In 1950 and 1951 the Corporation installed additional capacity in its steam and diesel plants, and constructed a large mileage of transmission lines. The main additions to plant capacity were the installation of a 15,000-kw. turbo-generator in the Estevan plant, and a 1,200-h.p. gas-diesel unit in the Unity plant. The 69,000-volt lines constructed were: Prince Albert-Beatty-Melfort-Tisdale; Beatty-Watrous; Tisdale-Nipawin; and one line of 33,000 volts (Saskatoon-Perdue-Biggarr-Rosetown) was built. The principal 24,000-volt lines constructed were: Montmartre-Kipling; Melville-Kelliher; Trossachs-Ogema-Bengough-Viceroy; Tisdale-Weeks; Plato-Kyle; Willow Bunch-Rockglen-Coronach; and Dodsland-Herschel.

The Power Corporation has continued its program of rural electrification under the provisions of the Rural Electrification Act 1949 as amended. The number of rural customers supplied by the Corporation was 2,608 at the end of 1949, 4,600 at the end of 1950, and 7,600 at the end of 1951.

The Cities of Regina and Weyburn, as well as certain towns and villages, own and operate their own municipal plants and distribution systems. In Moose Jaw and in a number of small towns and villages, local plants and distribution systems are owned and operated by private companies or individuals.

24.—Growth of the Saskatchewan Power Corporation (formerly Commission), 1942-51

NOTE.—Figures for the years 1929-1933 will be found at p. 499 of the 1947 Year Book; and for the years. 1934-1941, at p. 578 of the 1950 edition.

Control and regulatory powers regarding franchises for the supply of electric energy and the rates to be charged therefor are conferred upon the Local Government Board by Part III of the Public Utilities Companies Act (R.S.S. 1940, c. 118). Control and regulatory powers regarding the construction, extension and operation of generating plants, distribution systems and transmission lines are conferred upon the Saskatchewan Power Commission by the Power Commission Act 1950 (Statutes of Sask. 1950, c. 9).

Alberta.—Public ownership of power-generating and distributing systems in Alberta is confined to certain urban municipalities. The regulatory authority over privately owned systems is the Board of Public Utility Commissioners, which has jurisdiction over the distribution and sale of electricity. The Board has power to hold investigation upon complaint made either by a municipality or by a utility company and, following such investigation, may fix just and reasonable rates.

There are three private utility services in the Province: Calgary Power Limited, Canadian Utilities Limited, and Northland Utilities Limited. A synopsis of these services is given below.

Calgary Power Limited.—This Company has eight hydro-generating plants on the Bow River and its tributaries, west of Calgary. These plants are: Horseshoe Falls; Kananaskis Falls; Ghost River; Cascade; Barrier; Spray; Rundle and Three Sisters. At Dec. 31, 1951, the Company's total plant capacity was 206,550 horse-power. Barrier plant, completed in 1947, was the Company's first plant to be operated by remote control. Recently, Cascade, Three Sisters, Spray and Rundle plants were linked to a central control room at Kananaskis. The remaining plants will be remote-controlled as soon as the installations can be made. The Company has reservoirs at Lake Minnewanka (180,000 acre-feet), Interlakes (Kananaskis Lakes) (90,000 acre-feet), Spray Lakes (200,000 acre-feet), and forebay storage of 74,000 acre-feet at Ghost.

Power from these plants, together with that received under interchange agreements with the Cities of Lethbridge and Edmonton, is fed into a transmission network which supplies the entire electrical requirements of the Cities of Calgary and Red Deer and 235 smaller urban centres in central and southern Alberta. At Dec. 31, 1951, over 1,000 oil wells were being supplied with electric pumping service—

not to mention all the other loads directly related to the oil industry, such as gathering stations, refineries, pipe-line pumping, and the many large industrial plants recently located near Edmonton.

Calgary Power Limited transmission system, comprising over 4,100 miles of lines of all voltages, extends from Westlock in the north to Milk River in the south and from Macklin (Saskatchewan), Chauvin, Brooks and Taber in the east to Nordegg, Banff and Crowsnest Pass in the west. An eastern extension will soon be completed to link a new 30,000 kw. power plant at Medicine Hat with the system. The Cities of Calgary and Red Deer and the Towns of Ponoka, Macleod and Cardston are supplied on a wholesale basis and own their own distribution systems. All other points on the system are supplied on a retail basis. The Company has 3,529 miles of main transmission lines and 600 miles of distribution lines.

An extensive farm electrification program is in progress in Alberta and at Dec. 31, 1951, the Company was serving approximately 10,500 farms over 7,500 miles of the farmer-owned Rural Electrification Co-operative Association rural transmission lines. The program calls for the addition of from 2,500 to 3,000 farms each year for the next several years. Calgary Power does all the engineering, construction and operation of these co-operatives through a non-profit subsidiary—Farm Electric Services Limited—energy being supplied to the farm co-operative consumers at cost. Expenditures during the next five years for additional plant capacity, transmission lines and distribution systems will amount to an estimated \$50,000,000.

Canadian Utilities Limited.—Towns and villages northeast of Drumheller are supplied from a 13,500 kw. steam plant in that city by Canadian Utilities Limited, while towns and villages north and east of Vegreville are served from a new gas-fired 7,500 kw. steam plant at Vermilion. There are tie lines with the Calgary Power Limited system at Vermilion, Vegreville and Drumheller. This utility also serves the areas around Grande Prairie from a 2,300 h.p. diesel-engine plant located at that centre. The Company serves over 22,700 customers, in approximately 180 towns, villages and hamlets, including 48 Rural Electrification Associations in the Province, through a network of approximately 1,700 miles of transmission lines, and 1,375 miles of Rural Association lines.

In 1949, the Company embarked on a program of extending its lines to farmers on a co-operative basis. The system is constructed and operated at cost for the farmer.

Northland Utilities Limited.—This Company, with headquarters at Edmonton, supplies electric energy to 4,750 consumers in 25 northern communities. Diesel-generating plants are located at Jasper, Mayerthorpe, Athabaska, High Prairie, McLennan, Peace River, Lac La Biche, Manning, Fairview, Wildwood, and Hay River, N.W.T. Low-voltage transmission lines extending from these generating stations supply electricity to 200 farms and 14 villages. In addition, in 1948 the Company constructed a 665 kva. hydro plant on the Astoria River in Jasper National Park for the Department of Mines and Resources.

The Northland Utilities Limited also serves 1,000 consumers at Dawson Creek, B.C., with natural gas.

British Columbia.—The British Columbia Power Commission was appointed Apr. 17, 1945, under the provisions of the Electric Power Act, "an Act to provide for improving the availability and supply of electric power". Actual operations,

however, were commenced in August 1945 with the acquisition of electrical properties in several parts of the Province. The following statement shows the growth in the number of customers to April 1952:—

<i>Year Ended Mar. 31—</i>	<i>Services Acquired</i>	<i>Services Installed</i>	<i>Total Services for Period</i>	<i>Cumulative Services to End of Period</i>
	No.	No.	No.	No.
1946 (from August 1945).....	13,270	832	14,102	14,102

1952.....	103	2,600	2,703	45,912
Sold June 1951.....	—325	—640	—965	
TOTALS.....	27,189	18,723	45,912	45,912

This growth has been accompanied by a corresponding increase in generating capacity which, at Mar. 31, 1946, totalled 8,285 kw. By March 1952 this capacity had been increased to 123,845 kw. The number of power districts rose in that period from 12 to 25 and there was also a large increase in the line mileage in operation.

In 1946 the Commission established a promotional rate structure designed to "permit and encourage the maximum use of power" as required by the Act. This rate structure has been extended as fast as increased plant capacity and distribution systems were installed to take care of the growth in load anticipated through its introduction. By February 1952, promotional rates had been adopted in all 25 operating power districts.

The Commission's main development on Vancouver Island—the John Hart plant—is being enlarged for the third time. This plant, now comprising four turbines of 28,000 h.p. each, the equivalent electrical rating being 20,000 kw., is being augmented by the addition of the final group of two units of the same size. By the spring of 1953, this plant will have a capacity of 168,000 h.p. or 120,000 kw.

The John Hart development now serves, through Commission transmission and distribution systems, territory on Vancouver Island between Duncan and Campbell River, including the Comox Valley, Alberni, Lake Cowichan and Nanaimo. The B.C. Electric Railway Company Limited takes delivery of power at Nanaimo and transmits a large block for distribution in Victoria and environs, so that the John Hart development serves all main portions of Vancouver Island. The plant has brought two major industrial loads to the area with a third (at Duncan Bay) scheduled to commence operation in the summer of 1952.

On the mainland another major power project, the Whatshan Development on the west side of Lower Arrow Lake, has been completed. It is designed for an ultimate 66,000 h.p. capacity and the first two turbines of 16,500 h.p., generating 11,250 kw. each, began operation in May 1951. Power from this plant is transmitted 75 miles at 138,000 volts to Vernon in the Okanagan Valley. Through an inter-connection with Kamloops in the north and the West Kootenay Power and Light Company Limited lines to the south, a large area in the interior of the Province can be served by this project.

A third hydro-electric power development has been undertaken by the Commission. This is the Clowhom Falls plant, consisting initially of two 1,500 kw. generating units which began operation in May 1952. This construction will serve the Sechelt Peninsula, northwest of Vancouver.

Despite these large undertakings in the more populated areas of southwestern British Columbia, it is in the scattered and isolated communities of the Province that the people may have benefited most by the formation of the Commission. In less than seven years the diesel capacity of generating stations has increased from 880 to 12,295 kw., chiefly in these more remote and thinly populated areas.

Totals, Capital Investment..... \$	20,979,981	31,408,705	34,090,590	45,314,775

Sources of power for the year ended Mar. 31, 1952, were as follows:—

Source of Power	kwh.	p.c.
Hydro-electric energy.....	344,700,577	91.6
Diesel electric energy.....	30,928,309	7.6
Steam electric energy.....	306,875	0.1
Purchased power.....	2,817,547	0.7
TOTALS.....	378,753,308	100.0

The Northwest Territories and Yukon Territory.—The Northwest Territories Power Commission was created by an Act of Parliament in 1948 to bring electric power to points in the Northwest Territories where a need developed and where power could be provided on a self-sustaining basis. By legislation passed in 1949, the Act was extended to include Yukon Territory.

The Northwest Territories Power Commission has authority to construct and operate power plants as required in a territory having an area of over 1,500,000 sq. miles. The Commission is continually investigating power needs in this large area and studying reports on hydro-electric power sites that are available.

The Commission has in operation a hydro-electric power development on the Snare River some 94 miles northwest of Yellowknife, N.W.T. Power has been supplied from this plant since the autumn of 1948 to the mines in the Yellowknife area and, in the summer of 1949, a transmission line connection was completed to augment the supply of power to the Town of Yellowknife.

A diesel-generating station and distribution system was put into operation at Fort Smith, N.W.T., in October 1950. This project supplies the various government establishments at Fort Smith, e.g., the Departments of Resources and Development, Transport, National Defence (R.C.C.S.), Health and Welfare, and Public Works as well as the Royal Canadian Mounted Police and private commercial consumers and residents of the settlement.

In 1951, construction was commenced on a Commission-owned hydro-electric development on the Mayo River, approximately six miles north of Mayo Landing, Yukon Territory. It is expected that this plant will be delivering power to the Keno Hill and Galena Hill mining areas and to the settlement of Mayo Landing in the autumn of 1952.

The Commission conducts investigations throughout the Northwest Territories and the Yukon Territory wherever requests are made for power installations or where the Commission considers investigations should be made.

The total capital investment of the Commission as at Dec. 31, 1951, was approximately \$6,000,000.

Section 3.—Total Development of Electric Power from All Available Sources

In Section 1 of this Chapter total water-power resources are given with the proportion that, so far, has been developed. Table 3 of that Section analyses the hydraulic turbine installation by the proportions in central electric stations, in pulp and paper mills, and in other industries. This is useful material, but it does not take into account electric power developed in central electric stations or in other industries from sources other than hydraulic.

Section 2 covers the central electric station industry including stations under the public ownership of provincial and municipal governments and those under private ownership. Neither of these Sections, however, gives a complete presentation of the total electric power developed in Canada. All the hydraulic energy developed is not converted to electric power: there are a number of water wheels and water turbines used for direct drive that are not geared to electric generators. On the other hand, certain central electric stations in the Atlantic Provinces, Ontario and the Prairie Provinces generate electricity from steam or internal combustion engines. It is the purpose of this Section to show the total electric power generated from all available sources. Most of the power comes, of course, from central electric stations, the figures having been given in Table 4 of Section 2, p. 546. The total kilowatt hours of electric power generated by central electric stations is divided into that generated from water power and that generated from thermal engines of all kinds

As shown in Table 26 total electric power generated by central electric stations in 1950 was 48,493,718,000 kwh. For a complete presentation, the power generated by manufacturing industries for their own use and the power generated by the

primary mining industry for use in its own operations must be added. There are a few other sources of electric energy included, such as electric railways which produced 12,764,200 kwh. in 1950. This production has been taken into the annual total shown in Table 26. There are numerous small lighting and power plants on farms, rural homes, summer resorts, stores, etc., where electricity from central electric stations is not available and for these no data are available. The following table gives available data separately and as a combined total. Of the total electric power generated in Canada in 1950, 88.1 p.c. is shown to have been developed in central electric stations and, of this, 3.9 p.c. was generated by thermal engines (see Table 4, Sect. 2), the remainder having been produced hydraulically. Of the 11.9 p.c. generated by industry for its own use, 11.4 p.c. was developed by the manufacturing industries and 0.5 p.c. by the mining industry.

26.—Total Power Generated by Central Electric Stations, Manufacturing and Mining Industries, 1941-50

NOTE.—Figures for the years 1927-40 will be found at p. 516 of the 1948-49 edition of the Year Book.

Year	Central Electric Stations		Manufacturing Industries		Mining Industries		Total ¹
	'000 kwh.	p.c.	'000 kwh.	p.c.	'000 kwh.	p.c.	'000 kwh.
1941.....	33,317,663	91.3	2,840,841	7.8	299,119	0.8	36,479,140

CHAPTER XIV.—THE FISHERIES

CONSPECTUS

	PAGE		PAGE
SECTION 1. GOVERNMENTS AND THE FISHERIES.....	571	SECTION 2. FISHERY STATISTICS.....	585
Subsection 1. The Federal Government.....	571	Subsection 1. Primary Production.....	585
Subsection 2. The Provincial Governments.....	576	Subsection 2. The Fish-Processing Industry.....	590

NOTE.—*The interpretation of the symbols used in the tables throughout the Year Book will be found facing p. 1 of this volume.*

The immense fishery resources of Canada are derived from the prolific sea-fishing waters of the North Pacific and North Atlantic, and from numerous lakes and rivers of the inland provinces. Canada ranks high in fishery production and leads the world in monetary returns from the export of fishery products. (See Chapter XXI for fisheries exports.)

Fishing is Canada's oldest industry and although its relative importance in the nation's economy has diminished through the years, the industry has shown considerable expansion and is still of paramount consequence in the coastal provinces and in the inland areas adjacent to waters where commercial fishing is pursued. Of particular importance is the fishing industry of Newfoundland where, from the standpoint of number of people directly employed in the catching and processing of fish and those indirectly affected, it ranks first among the industries. In Prince Edward Island and in Nova Scotia, fish-curing and packing is the leading manufacturing industry and in New Brunswick and British Columbia it ranks third.

An account of the Canadian Fishing Grounds is given in the 1951 Year Book, pp. 472-475.

Section 1.—Governments and the Fisheries

Subsection 1.—The Federal Government*

The British North America Act gave the Federal Government full legislative responsibility for the regulation of the coastal and the inland fisheries of Canada. Under the Act, laws are made for the protection, conservation and development of the fisheries throughout the country. The provinces, however, have property rights in the non-tidal fisheries and have been delegated certain administrative responsibilities in varying degree. Consequently, while all the regulations governing fishing are made by the Federal Government, the work of administering the fisheries (enforcing the different laws and regulations, inspecting fish products, issuing licences, etc.) is done in some cases by federal officers and in others by provincial officers, according to arrangements made with the different provinces and without duplication of staff.

* Revised in the Department of Fisheries, Ottawa.

Specifically, all tidal or sea fisheries, except those of Quebec, are administered by the Federal Department of Fisheries while the fresh-water or non-tidal fisheries, with some exceptions, are administered by the Provincial Departments. The exceptions are the Yukon and Northwest Territories, Nova Scotia, New Brunswick, Prince Edward Island and Newfoundland where the fresh-water fisheries are federally administered.

The work required in the conservation, development and general regulation of the nation's coastal and fresh-water fisheries is performed by three agencies under the Minister of Fisheries:—

- (1) The Department of Fisheries proper, with headquarters at Ottawa and area offices under Chief Supervisors at Vancouver, Winnipeg, Halifax and St. John's.
- (2) The Fisheries Research Board of Canada, with headquarters at Ottawa and seven stations across Canada.
- (3) The Fisheries Prices Support Board, with headquarters at Ottawa.

The Department of Fisheries.—The chief responsibilities of the Department of Fisheries throughout Canada are, in brief, to conserve and develop Canada's primary fishery resources; to encourage the development of the fishing industry in the national economy; to inspect fish products, establish standards of quality and promote the optimum utilization of the resource; and to develop a proper public understanding of the resource and the industry.

The larger part of the Department's working force is stationed in the field in the four above-mentioned areas, and is comprised mainly of a protection staff and an inspection staff. The Protection Officers, including those on the Department's 64 patrol and protection vessels, are concerned with the enforcement of the conservation regulations under the Fisheries Act and other Acts designed to ensure a continuing maximum yield of fish. The Inspection Officers are responsible for the inspection of fish products and processing plants under the Fish Inspection Act and relevant sections of the Meat and Canned Foods Act.

The conservation program of the Department is carried out by the Conservation and Development Service. Protection officers not only enforce regulations pertaining to restricted areas, close seasons, limitations in location and types of gear, but they inspect spawning streams and keep them clear of obstructions. Engineers of this Service construct fishways to enable fish to by-pass dams. Hatcheries are maintained to restock waters where the fisheries are federally administered.

To ensure a high standard of quality, inspection of fish and fish products is carried out by the Inspection and Consumer Service. Fish inspection laboratories are maintained on the Atlantic and the Pacific Coasts. The Service also has a staff of home economists who operate a test kitchen at Ottawa and carry out demonstrations and lectures on methods of preparing and cooking fish and fish products.

Through the mediums of printed material, films, radio and exhibitions, the Information and Educational Service keeps the public informed on the various aspects of the industry and the work of the fisheries service with the object of developing a better understanding of the resource and those engaged in its exploitation. The Service works closely with the Conservation and Development Service in matters concerning conservation of fisheries, and with the Inspection and Consumer Service toward encouraging increased consumption of Canadian fish products in both North American and export markets.

The Markets and Economics Service, which has a staff of economists and market analysts, is responsible for bringing together a fund of factual information, through surveys and other means, on the primary fisheries and on the processing, transportation and distribution of fishery products. Such facts and their interpretation form the basis for development and other programs of the Department. In the marketing field continual study and interpretation is carried out on market trends in the foreign and the domestic fields. In co-operation with the Department of Trade and Commerce and its Trade Commissioner Service, work is being done on the development and extension of export markets for Canadian fish.

In addition to providing these regular services, the Department assists the commercial fishing industry in several special ways. For the purpose of promoting efficient primary fishing operations and improving the marketing of fishery products, assistance is provided for the construction of draggers and long-liners and for bait-freezing and storage facilities on the Atlantic Coast. Restrictions against trawlers have been eased to permit the licensing of new trawlers built in Canada or the United Kingdom. For each new trawler built in Canada, the owner is eligible for a licence to operate a used trawler imported from either the United Kingdom or the United States and registered in Canada after payment of duty. A bona fide applicant wanting only one trawler can import a used one from the United Kingdom without having to lay down a new keel in Canada.

The Department also provides assistance in the education of fishermen by making payments to educational institutions that have agreed to carry out adult educational work among fishermen.

The Fisheries Research Board.—Under the Fisheries Research Board of Canada Act, 1937 (c. 37), the Board has charge of all federal fishery research stations in Canada. It consists of 15 members appointed for five-year terms by the Minister of Fisheries. Nine of the members are scientists from universities or other institutions engaged in research work bearing on fishery problems; four members represent the fishing industry; and two members are from the Department of Fisheries.

The general types of work of the Board are biological and technological and are carried out at seven stations: the Biological Station at St. Andrews, N.B., with its substation at Ellerslie, P.E.I.; the Pacific Biological Station, Nanaimo, B.C.; the Central Fisheries Research Station, Winnipeg, Man.; the Newfoundland Fisheries Research Station, St. John's, N'f'ld.; the Atlantic Fisheries Experimental Station, Halifax, N.S.; the Pacific Fisheries Experimental Station, Vancouver, B.C.; and the Gaspé Fisheries Experimental Station at Grande Rivière, Que.

Scientific investigations are an important part of the development of the commercial fishing industry and provide the basis for conservation measures put into effect by the Department. Almost all the principal stocks of commercial fish are under observation by the Board's biologists. Many species, such as Pacific salmon, Atlantic salmon, Atlantic groundfish, lobster, herring, albacore, whitefish, whales, oysters and clams, are being studied intensively. The studies provide knowledge of the life history, growth rate, reproduction, distribution, enemies, diseases, etc., of the fishes, shellfish and sea mammals. Special investigations are undertaken as problems arise. A few years ago the Board conducted a survey of the fisheries resources of the Northwest Territories and, at present, it is exploring the fisheries resources of Canada's Eastern Arctic.

Fundamentally, the object of the Board's technological investigations is to eliminate waste in the fishing industry. To attain this objective it is necessary to utilize not only all fishery products that come out of the waters but to put those products to the best possible use in the light of current knowledge. The Board's knowledge is continually expanding through basic and applied research and this is helping to bring about a wider distribution of fishery products, a higher level of quality in the products marketed, a better understanding of the use of fish in general nutrition and of fish by-products for food, medicinal and industrial purposes.

The Fisheries Prices Support Board.—Under the Fisheries Prices Support Act passed in 1944, this Board was set up in July 1947 to recommend, to the Government, price support measures when severe price declines occur. The Board functions under the direction of the Minister of Fisheries and consists of an Acting Chairman, who is a senior officer of the Department of Fisheries, and five members chosen from private and co-operative firms in the industry, representative of the various fish-producing regions of Canada.

The Board has authority to buy quality fishery products under prescribed conditions and to dispose of them by sale or otherwise, or to pay to producers the difference between a price prescribed by the Board and the average price the product actually commands. The Board has no power to control prices nor has it any jurisdiction over operations in the fishing industry or the fish trade.

Money necessary for dealings in fishery products is available to the Board from the Consolidated Revenue Fund to a maximum aggregate amount of \$25,000,000 but only on recommendation of the Federal Treasury Board and authorization of the Governor in Council. The most recent prices support action by the Board resulted from marketing problems in respect of Newfoundland salted codfish.

The Board maintains a small staff at Headquarters for those administrative and research activities essential to operation. The work of the staff is closely integrated with that of the Department's Markets and Economics Service and, where possible, all services required by the Board are carried out by Departmental personnel. The Board has carried out field surveys on market conditions and possibilities, and on factors affecting the income of fishermen in the various producing areas. It keeps the financial position of fishermen under continuous review and makes recommendations to the Government on the basis of the facts as it finds them. Special investigations are made when serious problems arise in particular areas.

International Fisheries Conservation.—Because fisheries regulation is sometimes needed on the high seas in international waters, international treaties have had to be made. Canada's obligations under a number of international fishery treaties with the United States and other countries are administered by the Department of Fisheries.

Canada and the United States for years have led the world in joint fisheries conservation development. Major examples of this joint effort are the International Fisheries Commission, concerned with the preservation of the halibut stocks of the North Pacific and the Bering Sea, and the International Pacific Salmon Fisheries Commission, concerned with the conservation and development of the sockeye

salmon of the Fraser River. Investigations carried out under the Commissions' auspices, subsequent regulation and limitation of catches and, in the case of salmon, the construction of fishways, appear to have been successful in arresting and reversing an earlier trend towards depletion of these fisheries. Another case of restoring a depleted marine resource by international agreement and action is that of the fur seals of the Pribilof Islands in the Bering Sea. Under the Provisional Fur Seal Agreement, Canada receives 20 p.c. of the fur-seal skins taken annually by the United States Government from the Pribilofs. Only surplus animals are killed and the herd, once reduced almost to extinction by uncontrolled slaughter, is now believed to consist of more than 3,000,000 seals.

In 1949, the Government of Canada became a signatory, along with ten other countries, to the International Northwest Atlantic Fisheries Convention which came into force in 1950. The work of the Commission established under this Convention concerns the scientific investigations of the fishery resources of the northwest Atlantic. The Commission has no regulatory powers but will make recommendations to the respective governments regarding measures that may be necessary for maintaining the stocks of fish that support the international fisheries in the Convention area. The first meeting of the Commission was held at Washington, D.C., in April 1951. At that time the Treaty had been ratified by Canada, Denmark, Iceland, the United Kingdom and the United States. Other signatories to the Treaty are France, Italy, Norway, Portugal and Spain. Temporary headquarters of the Commission is at the Fisheries Research Board Biological Station, St. Andrews, N.B.

A step towards international action in regulating the high seas fisheries of the northern Pacific Ocean was achieved in December 1951, when Canada, the United States and Japan conferred at Tokyo and reached an agreement on fisheries problems. A draft convention was drawn up and referred to the three Governments for acceptance but it has not as yet (November 1952) received final ratification. The Convention aims at providing the maximum sustained yield of the fishery resources of the northern Pacific non-territorial waters with each of the parties assuming obligations to encourage conservation measures. It provides also for the establishment of a commission representing the three parties. The commission will study the northern Pacific fisheries, determine the application of the treaty principles and will promote and co-ordinate the scientific studies necessary for ascertaining conservation programs.

Under existing principles of international law, all nations have an equal right to exploit the fishery resources of the high seas. Problems have arisen when attempts have been made to conserve certain resources and the Convention is the first attempt to meet these problems. By joint agreement, Canada, the United States and Japan are prepared to waive some of these international rights and, under certain conditions, to abstain from fishing stocks that are under conservation by one or more of the other parties. Halibut, salmon and herring off the British Columbia coast meet the conditions of the Convention and Japan has agreed to abstain from fishing these resources.

Canada is a member of the International Whaling Commission and was represented at the third annual meeting of the Commission in 1951 at Capetown, Union of South Africa. Canada is obligated to collect additional biological data. Whaling operations are carried out off Newfoundland and the British Columbia coast.

Subsection 2.—The Provincial Governments*

An outline of the work undertaken by each of the Provincial Governments in connection with administration of commercial and game fisheries is given in the following paragraphs.

Newfoundland.—The union of Newfoundland with Canada on Mar. 31, 1949, brought about a transfer of some responsibilities in fisheries administration. The Newfoundland Fisheries Board remained the agency of government in the supervision of salt-codfish marketing, but fish and plant inspection, operation of bait depots, etc., became the concern of the Federal Department of Fisheries. The Board, formerly responsible to the Government of Newfoundland through the Commissioner for Natural Resources, became responsible to the Minister of Fisheries for Canada.

The Provincial Government is concerned mainly with improvement and development in fishing and production methods and has conducted experiments in long-lining and deep-water trawling, in the construction of multi-purpose fishing craft and in the exploration of potential fishing grounds. Steps are being taken to secure more efficient use of fisheries salt. Loans have been made available to processors for the establishment or development of fishing fleets and processing plants, and to fishermen for the construction and purchase of modern vessels capable of greater variety of fishing operations and larger production.

In 1951, the Governments of Canada and Newfoundland established the Newfoundland Fisheries Development Committee, consisting of representatives of fishermen, processors and exporters, and of both Governments. The objective of this Committee is to establish the role of each sector of the industry and each government, jointly or severally, in the organization and development of the fisheries. Action has been taken by both Governments in certain matters considered as necessary preliminaries to an over-all program, such as an economic and sociological survey of fishing settlements, and the encouragement of the use of community, rather than individual stages and rooms by shore fishermen.

The inland waters of Newfoundland, which provide excellent sport fishing, are not commercially exploited to any significant degree. The lakes and ponds remain under the authority of the Natural Resources Branch of the provincial Department of Mines and Resources, but the rivers and streams—the resort of migratory fish such as salmon and sea trout—passed under federal jurisdiction as a consequence of the union. Matters of conservation and guardianship are, therefore, mainly or wholly the concern of the Federal Department of Fisheries, although to the extent to which they affect the ponds and lakes they are subject to provincial or joint action.

Prince Edward Island.—The major responsibility for aid to the fisheries of this Province is undertaken by the Federal Government. Prince Edward Island, however, has established a Department of Industry and Natural Resources which administers the commercial and game fisheries.

Consultations were held in 1950 with marine architects and fishing ports were visited along the Atlantic seaboard with a view to obtaining the best information on boats and gear most adaptable to the Province's coastal waters. These

*Prepared by the respective provincial departments responsible for fisheries administration.

studies resulted in the adoption of the 60-ft. Island Dragger. During the search for information on boats, much was learned of the possibility of adapting the drag-net principle to smaller boats and experiments were conducted to ascertain power requirements and general feasibility. The major part of the revenue of the commercial fishermen of the Province is provided by lobster, smelt and oyster catches.

The streams of the Province are, as a whole, mostly spring fed and fairly constant in flow, thus providing excellent spawning grounds and nurseries for game fish, of which speckled trout are by far the most important. With such favourable conditions for reproduction the problem is to increase the production of trout of a size attractive to anglers. Comprehensive biological investigations are being carried on by the Fisheries Research Board to attain this objective by determining the most efficient procedure in stocking, managing and cropping. The Province provides the sites for these investigations and the Conservation and Development Branch of the Federal Department of Fisheries builds the necessary dams and supplies the fish required for experimental purposes.

The angling pressure in this Province is continuing to increase but many of the fertile and highly productive ponds have disappeared. During 1951, the Department, with a view to readjusting this situation, has repaired dams and restored many ponds and thus opened to the public, subject to the prevailing fishery regulations, many angling areas.

Nova Scotia.—The basic responsibility for the administration of tidal and inland fisheries in Nova Scotia is undertaken by the Federal Government. The Province, however, supplements the activities of this authority through its Department of Trade and Industry. In practice a system of co-operative effort has been worked out between the two authorities with each free to carry out individual responsibilities and specific programs. Provincial activities fall into three sections: development, administration and research.

Development.—Development activities include engineering services, financial assistance to the fisheries industry generally, and educational services to the fishermen.

Engineering services are related to the design, construction and equipment of boats, vessels and fish-processing plants. A marine engineer is employed for these services and for the extension of consultant services to all persons interested in the industry. Financial assistance is extended, by way of loans, for the construction and modernization of fish-processing plants and to fishermen for the acquisition of boats and engines. Where the requirements of large new plants have exceeded the capacity of local authorities, the Department's assistance has included provision of utilities such as water lines and rail sidings and the operation of a bait freezer at Cheticamp.

Educational services extended to fishermen comprise instruction in basic navigation, rules of the road, and care and maintenance of marine engines by means of short courses at selected outposts and a permanent school maintained at Lunenburg. This educational program is assisted by grants from Canadian Vocational Training, Federal Department of Labour, under the provisions of the Vocational Training Co-Ordination Act.

Administration.—The Nova Scotia Fisheries Act serves to supplement federal jurisdiction and is administered jointly by the Department of Trade and Industry and the Federal Department of Fisheries. The Act requires fish plants and

fish buyers to obtain annual licences issued by the Department of Trade and Industry only on the recommendation of inspectors of the Federal Department of Fisheries and the certification of the Department of National Health and Welfare as to compliance with standards of construction, operation and sanitation contained in federal regulations.

Information obtained from the licensing activities and other statistics supplied by the Federal Department of Fisheries enables the Department of Trade and Industry to handle commercial and other inquiries in respect of the fisheries industry and to issue informational publications, such as the *Nova Scotia Fisheries Year Book* and directories of fish-packers and processors.

Research.—Provincial fisheries research activities have been confined largely to the inland fisheries for trout and salmon. The Department of Trade and Industry has carried out a four-year program of water control on the LaHave River in the interests of salmon preservation and development; has undertaken experiments in fertilization of lakes and in partial poisoning of lakes to reduce the numbers of coarse fish in competition with trout for the available food supply; and has conducted some special studies of trout populations and salmon migrations.

New Brunswick.—The commercial fisheries of New Brunswick are under the jurisdiction of the Federal Department of Fisheries. Since 1945, a Fisheries Division has been in operation under the Provincial Department of Industry and Reconstruction, now the Department of Industry and Development. In 1946, a Fishermen's Loan Board was established to provide financial assistance to bona fide fishermen for the purchase of new boats and engines. Since its formation this Board has loaned over \$1,150,000 of which over \$700,000 has been recovered to date. It has modernized the deep-sea fishing fleet by the introduction of a most effective small dragger 25 units of which are operating in the area of the Gulf of St. Lawrence.

Quebec.—The Minister of Game and Fisheries administers both the sea and inland fisheries of Quebec. The Department is composed of two divisions; the Division of Maritime Fisheries and the Division of Fish and Game, the latter being charged with the administration of the inland fisheries.

Sea Fisheries.—Quebec is the only province administering its own sea fisheries. For the benefit of producers and fishermen, it provides a system of cold-storage plants for the freezing and preservation of fish. Since the erection of the first plant in 1932, the network has grown to 50 plants with a daily freezing capacity of 250 tons of fish and a storage capacity of 16,000,000 lb. These cold-storage plants also perform a valuable service to fishermen by providing them with frozen bait. In addition, the Department owns and maintains 115 snow houses where fish may be chilled before being sent to storage or filleting plants; 40 culling sheds; and three artificial drying plants where 6,000,000 lb. of fish may be processed annually.

The Department maintains a staff of inspectors, fish wardens, technicians and technologists for the administration of fishery legislation and the application of new techniques to the expansion of the industry. The central administration is located at Quebec City, with an office at Gaspé for the administration of cold-storage plants. Statistics are compiled by the Department of Trade and Commerce in co-operation with the inspectors of the Maritime Fisheries Division.

Fish inspection is carried out under federal and provincial legislation by provincial inspectors, who are vested with additional powers for export purposes by the Federal Government.

Educational work among the fishermen and producers is also conducted by the Department in order to teach the latest methods of fish preparation and obtain high quality products. The new Fisheries Training School at Grande Rivière gives to fishermen of all ages the opportunity of taking free theoretical and practical courses in fishery, while the Superior School of Fisheries at Ste. Anne-de-la-Pocatière trains technologists in a four-year course. The encouragement given to the co-operative associations of fishermen through the Social Economic Service of this same institution constitutes another phase of the work.

Another form of assistance is the maritime credit system whereby fishermen are enabled to obtain loans from credit unions for the purchase of boats and gear. The Department adheres to the federal-provincial agreement on the building of dragners (small trawlers) and long-liners and assumes the building costs on a five-year capital refunding plan.

The fish trade is being promoted by advertising campaigns in newspapers and magazines, cooking demonstrations, educational films and free distribution of fish recipes and publicity leaflets, as well as at fairs and exhibits.

Hydrographical research in the Gulf of St. Lawrence and the location of new fishing grounds as well as experiments of all kinds on sea-fish biology are being conducted by the Marine Biological Station at Grande Rivière and the two substations of the North Shore and Magdalen Islands. This research has brought into use new types of modern fishing vessels recommended to fishermen.

Inland Fisheries.—The Division of Fish and Game exercises jurisdiction over the inland waters. Protection of the fish and game is in the hands of 300 full-time wardens. Residents are required to purchase a licence for sport-fishing and hunting and the proceeds are applied to the improvement of fishing and hunting conditions. Commercial, non-resident, tourist and club sport-fishing licences are also issued.

Five hatcheries are maintained at strategic points throughout the Province: St. Faustin, Lachine, Baldwin's Mills, Tadoussac and Gaspé. These establishments distributed nearly 9,000,000 fry, fingerlings and older fish, during the year ended Mar. 31, 1950, the species being speckled trout, Atlantic salmon and grey trout.

The Department administers four parks or reserves in which excellent fishing can be found. The Gaspé and Laurentides Parks are renowned for their trout fishing. The Chibougamau Reserve and the La Vérendrye Park, situated on the right of land, are eminently suited to canoe trips, in search of pickerel, pike and grey or speckled trout. Four salmon streams, all under the jurisdiction of the Fish and Game Division, are open to anglers: the Romaine River, the St. Jean River, the Petite Cascapédia River and the Matane River.

The Department co-operates with sportsmen through a joint committee composed of departmental officials and the directors of the larger fish and game associations. The Committee studies the maintenance of satisfactory fishing and hunting conditions and other problems arising out of the ever-changing conditions of modern life and their effect on the wildlife of the Province.

The Biological Bureau of the University of Montreal and the big piscicultural laboratory at Quebec City, with its two stations for practical work, located in the Mont Tremblant and Laurentides Parks, study problems connected with marine life.

Ontario.—Prior to 1946, the fishery resources of Ontario were administered by the Ontario Department of Game and Fisheries. That Department has since been incorporated into the Ontario Department of Lands and Forests as the Division of Fish and Wildlife and, in dealing with fishery matters, operates under the authority of the Fisheries Act (Canada), the Special Fishery Regulations for the Province of Ontario, the Ontario Game and Fisheries Act and the Regulations connected therewith.

Commercial Fishing.—The commercial fishing industry in Ontario provides employment to about 4,000 persons directly and to many more indirectly, and produces an annual harvest of between 25,000,000 lb. and 35,000,000 lb. of fish. The landed value revenue to licensed fishermen for the production of fish was \$7,034,000 for the year ended Mar. 31, 1951.

The industry, although widely scattered throughout the Province, is centred chiefly on the Great Lakes, particularly Lake Erie which is noted for its whitefish, herring and blue pickerel. Lake Superior continues to be the leading producer of lake trout. Other principal species of fish taken commercially in Ontario are: lake trout, yellow pickerel, herring or ciscoes, sturgeon, pike, catfish (including bullheads), carp and suckers.

Many of the smaller inland lakes are commercially fished, especially those in the northwestern portion of Ontario and careful management of these lakes is essential to ensure continued production.

Fishing boats vary from small craft to 60-ft. tugs, and types of gear used also vary from the most common gill net, pound and trap nets, seines and baited hooks to small hand-operated seines and dip nets.

Recent Developments.—Modern fishing methods and equipment have rapidly entered the fisheries industry in Ontario in the past few years. Diesel-driven steel-hull tugs have replaced the steam-driven wooden tug. New aids to fishing methods have been developed, such as depth-sounding devices, radar, ship-to-shore and ship-to-ship communications, and a better knowledge of the fish and their movements has been established from biological research findings. Modern icing facilities and transportation methods also are in use, as are new types of fishing gear. Nylon gill net is replacing cotton and linen nets and a very efficient and economical trapnet is gradually replacing the pound-net in Lake Erie and other waters.

With the use of these up-to-date fishing methods and equipment in Ontario fresh-water fishing industry, the administration and management, through excellent co-operation and understanding of the complex problems involved by both the Government and the fishermen, through their local associations and the Ontario Federation of Commercial Fishermen, are working out the best practices in the interest of all concerned and of the industry as a whole.

Angling.—In Ontario, with its estimated water area of 49,300 sq. miles, angling constitutes one of the most widely distributed recreations. There are 144 different kinds of fish in the Province, including such species as lake and speckled trout, yellow pickerel, black bass, pike and maskinonge.

Sport fishing may be considered one of the chief factors concerned with the increase and development of the tourist trade and, while it is difficult to measure the value of this resource, a revenue of \$1,450,180 for the year ended Mar. 31, 1951, was obtained from the sale of angling licences, mainly to non-residents as residents require a licence for Provincial Parks only.

In order to maintain Ontario's reputation for excellent game-fishing, the management of this renewable resource is a prime factor, and a well-trained field staff of conservation officers and biologists is located in the 22 forestry districts of the Province.

Fisheries Research.—In 1947, the South Bay Experiment, under an Advisory Committee composed of representatives of the Fisheries Research Board of Canada, the Ontario Government, the Ontario Federation of Commercial Fishermen, the Ontario Federation of Anglers and Hunters and the Northern Ontario Outfitters Association, was begun on Manitoulin Island in Lake Huron to determine the benefits to the yield of the more valuable fish by exerting equal fishing pressure on the less valuable or worthless fish.

The increase in the sea lamprey and the drastic drop in production of lake trout in recent years in Lake Huron (including Georgian Bay and North Channel) are believed by many authorities to be directly related and have led to considerable joint research by the Ontario Government and by Federal and State Governments in the United States. Co-operation is maintained in the exchange of biological findings and, where practicable and feasible, the results are applied in an attempt to control this menace.

Other fields of fishery research include those carried out at the Ontario Fisheries Research Laboratory in Algonquin Park and at the Southern Research Station at Maple which was established in 1948 by the Provincial Government in co-operation with the University of Toronto.

Established fish-management principles are applied by biologists in the various forestry districts. Their program includes such projects as biological surveys and investigations, bass harvesting, coarse fish removal, sea lamprey control, creel census studies, fish tagging and other related subjects.

Provincial Hatcheries.—In order to supplement natural restocking, Ontario has 28 hatcheries and rearing stations. Excellent results have been produced in the culture and distribution of the various species of both commercial and game fish. The distribution for the year ended Mar. 31, 1950, numbered 583,368,799, comprising whitefish, herring, pickerel, trout (including lake, speckled, brown and Kamloops), masknonge, bass and ouananiche.

Two of the finest trout-rearing stations on the Continent are found in Ontario at Dorian, near Port Arthur and at Hill Lake, near Englehart.

Manitoba.—The commercial fisheries of Manitoba, where there are 26,789 sq. miles of lakes and rivers, yield an annual harvest of fish in excess of 30,000,000 lb. This huge catch is worth approximately \$5,000,000 annually and the greater part is shared by the commercial fishermen who number over 7,000. About 90 p.c. of the Manitoba fishery production is exported to the United States, assisting materially the national balance of trade. In recent years the main efforts of the industry have been directed toward improvement in quality. Adequate cold storage facilities are available in the large centres; freighting boats are equipped with mechanical refrigeration, packing sheds are provided with cooling rooms and fishermen are allowed an unlimited amount of crushed ice so that the catch may be placed in ice as soon as removed from the nets. During the winter fishing seasons the fish is rushed to railhead by modern rapid transportation, including aeroplane, bombardier-snowmobile and tractor trains. The filleting industry has expanded

significantly and much of the catch is now prepared ready to cook and attractively packed in cartons. Lakes producing whitefish are surveyed annually to ascertain the quality of fish therein. Catch limits on most of the commercially fished lakes are set and rigidly enforced but an experiment is now in progress in a commercially fished lake to improve quality by intensive fishing. In two of the larger summer fishing operations, individual catch limits were set and have been found satisfactory.

The Province of Manitoba operates four fish hatcheries and two spawn-taking camps on commercially fished lakes. In the Provincial Park areas one sport-fish hatchery is in operation and one egg-collecting camp. From these hatcheries 81,550,000 whitefish eyed eggs and fry were planted on natural spawning grounds in Lake St. Martin and Lake Winnipeg. In Lake Manitoba and Lake Winnipegosis 107,300,000 pickerel eyed eggs and fry were distributed. In 1951, 616,660 trout fingerlings from the Whiteshell Trout Hatchery were liberated in sport-fishing waters of the Whiteshell Provincial Park and in the Duck Mountain area and lakes north of The Pas. A program of introducing adult fish into lakes is being carried out. Emphasis is also being placed on the poisoning of lakes and restocking with rainbow trout.

Sport fishing in Manitoba is increasing in importance, judging by the annual demand for non-resident angling licences in summer, and for resident and non-resident angling licences in winter.

Saskatchewan.—The administration of fisheries in the Province of Saskatchewan comes under the Fisheries Branch of the Provincial Department of Natural Resources with its head office at Prince Albert. Most of the fisheries resources are concentrated in the northern half of the Province, where the lakes have always been a source of food to the fur trader, trapper, prospector and the Cree and Chipewyan Indians who inhabit the area, and also provide food and supplementary income to the settler and homesteader on the agricultural fringe.

The Province of Saskatchewan has 13,725 sq. miles of water and the principal species of fish include lake trout, whitefish, pickerel, northern pike, sturgeon, cisco, Arctic grayling, goldeye, mullet, perch and burbot.

There are approximately 110 commercially fished lakes in the Province. In the year ended Mar. 31, 1951, the total commercial production of fish of all species amounted to 8,731,292 lb. with a railhead value of \$1,360,114. Since 1945 the growth of the filleting industry has been of particular significance and 15 filleting plants have been established. Annual production of fillets is now over 1,000,000 lb. Total sales of fish in the Province in 1950-51 were 1,986,776 lb., which represents a considerable increase over the past number of years. The fishery resources are also important to domestic fishermen and to mink ranchers in the Province. In 1950-51 65 fur-farm fishing licences were issued and a total of 25,774 mink were fed under these licences; 637 domestic licences and 1,463 free licences to Indians were also issued.

There has been marked development recently in sport fishing. For the fiscal year 1950-51 there were 33,336 resident and 5,366 non-resident angling licences sold, compared with 6,000 resident and 1,500 non-resident licences sold in 1944. The recreational value of sport fishing in the Province has a great potential.

The main endeavour in the fish cultural activities in the Province in recent years has been to extend the range of the Arctic grayling species from the Far North into the Churchill River area, and the introduction of Eastern brook

trout and certain warm water species into areas where preliminary study seems to indicate that the environment was suitable. To a large extent the indiscriminate planting of fish has been discontinued. A fish hatchery is operated at Fort Qu'Appelle for the hatching-out of pickerel, rainbow, brown and lake trout, and two experimental ponds have been built. The purpose of these ponds is to study, under controlled conditions, the introduction of warm-water species from the United States. An experimental hatchery has been established at Lac la Ronge, where Arctic grayling and lake trout eggs have been hatched. An Arctic grayling spawn-camp has also been established in the Fond-du-Lac River, near Black Lake and a pickerel spawn-camp is located on the Montreal River, near Lac la Ronge.

The management of the provincial water areas has been placed on a scientific basis. In 1947 a large-scale biological program was undertaken and more than 100 water areas have since been studied. The main emphasis has been on the study of productivity of the various water areas as well as the inter-relationship of the species and life histories. In so far as known facts will permit, the management of the various lakes has been placed on a sustained-yield basis. Experiments are in progress on the introduction of non-native species into suitable water areas. Where sport-fishing pressure has increased, such as on Lac la Ronge, Last Mountain Lake and Amisk Lake, a creel census has been established and the annual harvest is recorded. A Fisheries Laboratory was established in 1949 at the University of Saskatchewan and a permanent biologist was added to the staff. Approximately 12 graduate and undergraduate biological students of the University are employed each summer on biological surveys.

Progress has also been made on technological research. At Prince Albert a pilot plant was established where experimental smoking and canning is conducted. As a result of this research work, the sales of smoked fish in the Province has increased very considerably. A Research Committee was established at the University of Saskatchewan to study certain aspects of the canning of inland fish, particularly the problem of the muddy flavour which appears to be present in the summer-caught fish from Last Mountain and Primrose Lakes.

The Fisheries Branch has conducted a program of education designed to acquaint people of the Province with the importance of scientific research and the necessity of certain regulations governing the administration of fisheries. Under the scientific program, three 16 mm. colour and sound films have been made on sport fishing during the past three years.

Alberta.—Commercial and game fishing are administered by the Fisheries Branch of the Department of Lands and Forests.

Regulations under the Fishery Act (Alberta) designed for improvement in the packing, handling, processing, storage and quality of commercial fish have been well received and supported by the Alberta industry. In line with a policy for producing good-quality fish, lakes in which whitefish are infected with the pike tapeworm and do not meet the quality standard have been closed to commercial fishing.

Biological surveys of many lakes and streams over the past ten years have provided an opportunity to observe the result of past management policies. It was found that the classical tenets of trout-stream management, including close seasons, legal minimum, feeder stream closure, and hatchery plants, were inadequate or incorrect. A new management plan featuring the 'fallowing' of smaller tributary

streams, abolition of the legal size minimum, except in the case of lake trout, and a continuous open season on large streams and rivers, is being conducted. In addition, there is no close-season angling for pike, pickerel and perch. Trout rearing stations and a provincial trout hatchery support trout stream populations whenever required in cases of natural disaster, severe winter kill, introduction of new species or areas that have no spawning grounds.

A long-term experiment to test the effectiveness of the Canyon Creek whitefish hatchery was begun in 1941 by planting "eyed" eggs in a series of lakes in alternate years. The evidence gathered from a series of five lakes, 12 to 462 sq. miles in area indicated that the hatchery-supported year classes were no stronger than those not supported. Observations on the efficiency of natural reproduction indicated that about 10 p.c. of the eggs survive to become fry, which is sufficient to produce about one hundred times the number of adult fish a lake can support. Thus, although eyed eggs introduced by the hatchery also survived and produced fry, as evidenced by the successful re-stocking of several lakes formerly without whitefish, natural reproduction was found to be sufficient and can provide more than additional stock from the hatchery and thus, would not change the ultimate result. The whitefish hatchery was, therefore, closed.

British Columbia.—The Provincial Department of Fisheries was organized in 1901-02 and shortly became very active in fish-cultural work, building and operating fish hatcheries and instituting scientific research into various fishery problems.

Broadly speaking, the administrative and regulative jurisdiction over the fisheries in British Columbia rests with the Federal authority. When British Columbia entered Confederation in 1871, the Government of Canada undertook to protect, conserve and promote the fisheries of the Province, and one of the important functions of the Provincial Department of Fisheries is to observe these aspects and to keep the Provincial Government informed through the appropriate Minister.

The ownership of the fisheries in the non-tidal waters is vested in the Crown, in the right of the Province, as are the shell-fisheries, such as oyster-fishing and clam-fishing in the tidal waters. The authority to administer and regulate these fisheries is vested in the Province, although the regulations covering them are made under federal Order in Council on the advice and recommendation of the Province.

The Provincial Department of Fisheries is charged with the administration of the Fisheries Act and with such other duties as may be assigned to it by the Lieutenant-Governor in Council. The Act provides for the taxation of the fisheries and, under civil and property rights, for the regulation and control of the various fish-processing plants under a system of licensing. Provision is also made in the Provincial Fisheries Act for the settlement by arbitration of disputes regarding fish prices that may arise between the fishermen and operators of the various licensed plants. The administration of the Act involves the collection of revenue and the supervision of plant operations in conformity with regulations made under the Act. The collection and publication of certain statistics and other pertinent data relative to the industry are also the responsibility of the Provincial Department of Fisheries.

Net-fishing in the non-tidal waters of the Province, including commercial fishing, is regulated and administered by the Provincial Department of Fisheries, while authority for regulation of the game fisheries in the non-tidal waters is vested

in the Game Commission, a branch of the Provincial Government administration. The Game Commission operates a number of trout hatcheries and egg-taking stations for re-stocking purposes.

The harvesting of marine plants of commercial importance in British Columbia, including the kelps, has recently been placed under the Provincial Department of Fisheries for regulation and control. Some research has already been done on a few of the more important species and more will be undertaken as required.

The Provincial Department of Fisheries has established a marine laboratory at Ladysmith, on Vancouver Island, for the purpose of conducting biological research into those species over which the Province has control, principally oysters, clams, and other forms of shell-fish as well as marine plants. This research is conducted with the object of encouraging the industry to produce better products more economically and of enabling the Department to regulate the various species so that maximum exploitation may be obtained on a sustained yield basis. The Department co-operates closely with the research work done by the Fisheries Research Board of Canada, particularly on the Pacific Coast.

Section 2.—Fishery Statistics*

Subsection 1.—Primary Production

The commercial fisheries of Canada (exclusive of the Province of Newfoundland) yielded \$151,982,000 in marketed value in 1950, an increase of nearly 16 p.c. over the 1949 figure of \$131,138,000. Although the total quantity of fish landed in 1950 reached a new peak of 1,491,222,000 lb., 4 p.c. higher than the previous record of 1,431,660,000 lb. in 1948, the increase in marketed value was due mainly to higher average selling prices for many species and the development of those products that command higher prices, particularly in foreign markets.

The data for Newfoundland are excluded from the following tables as no attempt was made to collect the comparable information. Steps were taken in 1952 to collect the principal statistics from all the important fish-processing firms in that Province and these data will be included in the tables for 1951.

* Revised in the Fisheries Section, Industry and Merchandising Division, Dominion Bureau of Statistics.

1.—Marketed Values of All Products of the Fisheries, 1870-1950
